SCOPE	<div>The aim of Indonesian Journal of Electrical Engineering and Computer Science (formerly TELKOMNIKA Indonesian Journal of Electrical Engineering) is to publish high-quality articles dedicated to all aspects of the latest outstanding developments in the field of electrical engineering. Its scope encompasses the applications of Telecommunication and Information Technology, Applied Computing and Computer, Instrumentation and Control, Electrical (Power), Electronics Engineering and Informatics which covers, but not limited to, the following scope: Signal Processing[...] Electronics[...] Electrical[...] Telecommunication[...] Instrumentation & Control[...] Computing and Informatics[...]</div>

Table of Contents

Impact of sensorless neural direct torque control in a fuel cell traction system	PDF
Benhamou Aissa, Tedjini Hamza, Guettaf yacine, Nour Mohamed	2725-2732
Determination of the price for a hydro resource with consideration of operating conditions of hydropower plants using complex criteria of profit maximization	PDF
T. V. Myatezh, Y. A. Sekretarev	2733-2742
Reactive power sharing in microgrid using virtual voltage	PDF
Eder A. Molina-Viloria, John E. Candelo Becerra, Fredy E. Hoyos Velasco	2743-2751
Solar/wind pumping system with forecasting in Sharjah, United Arab Emirates	PDF
Waleed Obaid, Abdul-Kadir Hamid, Chaouki Ghenai	2752-2759
Intelligent control of battery energy storage for microgrid energy management using ANN	PDF
Younes Boujoudar, Mohamed Azeroual, Hassan Elmoussaoui, Tijani Lamhamdi	2760-2767
Four-leg active power filter control with SUI-PI controller	PDF
Mohamed M. El-sotouhy, Ahmed A. Mansour, Mostafa I. Marei, Aziza M. Zaki, Ahmed A. EL-Sattar	2768-2778
Numerical analysis of the photovoltaic system inspection with active cooling	PDF
Ahmed Hasan Mohammed, Ghanim Thiab Hasan, Kamil Jadu Ali	2779-2789
An electric circuit model for a lithium-ion battery cell based on automotive drive cycles measurements	PDF
Jaouad Khalfi, Najib Boumaaz, Abdallah Soulmani, El Mehdi Laadissi	2798-2810
Wind energy development in Morocco: Evolution and impacts	PDF
Touria Haidi, Bouchra Cheddadi, Faissal El Mariami, Zineb El Idrissi, Ali Tarrak	2811-2819
A review of intelligent methods for condition monitoring and fault diagnosis of stator and rotor faults of induction machines	PDF
Omar Alshorman, Ahmad Alshorman	2820-2829
Detection of internal and external faults of single-phase induction motor using current signature	PDF
Marwan Abdulkhaleq AL-Yoonus, Omar Sharaf Al-deen Alyozbak	2830-2841
Adaptive backstepping control of induction motor powered by photovoltaic generator	PDF
M. Madark, A. Ba-razzouk, E. Abdelmounim, M. El Malah	2842-2855
Adaptive hysteresis band current control of grid connected PV inverter	PDF
R. S. Ravi Sankar, A. Venkatesh, Deepika Kolipara	2856-2863
Nonlinear control strategy of single-phase unified power flow controller	PDF
Younes Abouelmahjoub, Mohamed Moutchou	2864-2875
Fuzzy logic power management for a PV/Wind microgrid with backup and storage systems	PDF
Aysar M. Yasin, Mohammed F. Alsayed	2876-2888
Design and performance evaluation of a solar tracking panel of single axis in Colombia	PDF
Hernando Gonzalez-Acevedo, Yecid Muñoz-Maldonado, Adalberto Ospino-Castro, Julian Serrano, Anthony Atencio, Cristian Jaimes Saavedra	2889-2898
Design new voltage balancing control series connected for HV-IGBT's	PDF
M. I. Fahmi, M. F. Mukmin, H. F. Liew, C. L. Wai, M. A. Aazmi, S. N. M. Arshad	2899-2906

Implementation of SHE-PWM technique for single-phase inverter based on Arduino Laith A. Mohammed, Taha A. Husain, Ahmed M. T. Ibraheem	PDF 2907-2915
Finite control set model predictive direct current control strategy with constraints applying to drive three-phase induction motor Anmar Kh. Ali, Riyadh G. Omar	PDF 2916-2924
Assessment of voltage stability based on power transfer stability index using computational intelligence models Ahmed Majeed Ghadban, Ghassan Abdullah Salman, Husham Idan Hussein	PDF 2790-2797
Insights on critical energy efficiency approaches in internet-of-things application Sharath S. M., Manjunatha P., Shwetha H. R.	PDF 2925-2933
Application of BaY2F8:Er3+, Yb3+ and Mg8Ge2O11F2:Mn4+ in improving the lighting quality of phosphor-in-glass based white light-emitting diodes with the dual-convex design Huu Phuc Dang, Phung Ton That	PDF 2934-2940
A simple multi-stable chaotic jerk system with two saddle-foci equilibrium points: analysis, synchronization via backstepping technique and MultiSim circuit design Aceng Sambas, Sundarapandian Vaidyanathan, Irene M. Moroz, Babatunde Idowu, Mohamad Afendee Mohamed, Mustafa Mamat, W. S. Mada Sanjaya	PDF 2941-2952
Compressor based approximate multiplier architectures for media processing applications Uppugunduru Anil Kumar, Syed Ershad Ahmed	PDF 2953-2961
One input voltage and three output voltage universal biquad filters with orthogonal tune of frequency and bandwidth May Phu Pwint Wai, Amornchai Chaichana, Winai Jaikla, Surapong Siripongdee, Peerawut Suwanjan	PDF 2962-2973
A novel 4 dimensional hyperchaotic system with its control, Synchronization and Implementation Basil H. Jasim, Anwer Hammadi Mjily, Anwer Mossa Jassim AL-Aaragee	PDF 2974-2985
A new energy regeneration system for A BLDC motor driven electric vehicle R. Palanisamy, Rohit Sahasrabudde, Mathur Kartik Hiteshkumar, Jay Anil Puranik	PDF 2986-2993
A smart fire detection system using iot technology with automatic water sprinkler Hamood Alqourabah, Amgad Muneer, Suliman Mohamed Fati	PDF 2994-3002
Improved control and monitor two different PLC using LabVIEW and NI-OPC server Ignatius Deradjad Pranowo, Dian Artanto	PDF 3003-3012
Autonomous vehicles: A study of implementation and security Firoz Khan, R. Lakshmana Kumar, Seifedine Kadry, Yunyoung Nam, Maytham N. Meqdad	PDF 3013-3021
Smart element aware gate controller for intelligent wheeled robot navigation Nadia Adnan Shiltagh Al-Jamali, Mahmood Z. Abdullah	PDF 3022-3031
Lane marking detection using simple encode decode deep learning technique: SeqNet A. Al Mamun, P. P. Em, J. Hossen	PDF 3032-3039
Small intestine bleeding detection using color threshold and morphological operation in WCE images A. Al Mamun, M. S. Hossain, P. P. Em, A. Tahabilder, R. Sultana, M. A. Islam	PDF 3040-3048
Bayesian learning scheme for sparse DOA estimation based on maximum-a-posteriori of hyperparameters Raghu K., Prameela Kumari N.	PDF 3049-3058
Breast cancer diagnosis system using hybrid support vector machine-artificial neural network Tze Sheng Lim, Kim Gaik Tay, Audrey Huong, Xiang Yang Lim	PDF 3059-3069
Image encryption under spatial domain based on modify 2D LSCM chaotic map via dynamic substitution-permutation network Rana Saad Mohammed, Khalid Kadhim Jabbar, Hussien Abid Hilal	PDF 3070-3083
Purging of silence for robust speaker identification in colossal database P. Rama Koteswara Rao, Sunitha Ravi, Thotakura Haritha	PDF 3084-3092
Device to evaluate cleanliness of fiber optic connectors using image processing and neural networks Victor Fernandez, Javier Chavez, Guillermo Kemper	PDF 3093-3105
Improved LEACH protocol for increasing the lifetime of WSNs Ikram Daanoun, Abdennaceur Baghdad, Abdelhakim Ballouk	PDF 3106-3113

Analysis of cyclic prefix length effect on ISI limitation in OFDM system over a Rayleigh-fading multipath Sarah Zanaifi, Noura Akinin	PDF 3114-3122
Location tracking using LoRa Norlezhah Hashim, Fakrulradzi Idris, Tuan Nur Anisa Tuan Ab Aziz, Siti Halma Johari, Rozilawati Mohd Nor, Norfariza Ab Wahab	PDF 3123-3128
Case-based reasoning system for prediction of fuel consumption by haulage trucks in open-pit mines Gomolemo Tadubana, Boyce Sigweni, Raymond Suglo	PDF 3129-3136
Smart cities: Understanding policies, standards, applications and case studies Surender Reddy Salkuti	PDF 3137-3144
Optimization of open flow controller placement in software defined networks Raghda Salam Al mahdawi, Huda M. Salih	PDF 3145-3153
A four-element UWB MIMO antenna using SRRs for application in satellite communications Chafai Abdelhamid, Hedi Sakli, Nizar Sakli	PDF 3154-3167
Detecting spam e-mails using stop word TF-IDF and stemming algorithm with Naïve Bayes classifier on the multicore GPU Manjit Jaiswal, Sukriti Das, Khushboo Khushboo	PDF 3168-3175
Improving traffic and emergency vehicle clearance at congested intersections using fuzzy inference engine Aditi Agrawal, Rajeev Paulus	PDF 3176-3185
Simulation based comparison of routing protocols in wireless multihop adhoc networks Ali H. Wheeb, Marwa T. Naser	PDF 3186-3192
VANET-Based Traffic Monitoring and Incident Detection System: A Review Mustafa Maad Hamdi, Lukman Audah, Sami Abduljabbar Rashid, Sameer Alani	PDF 3193-3200
The effects of using variable lengths for degraded signal acquisition in GPS receivers Anif Hussain, Hina Magsi, Arslan Ahmed, Hadi Hussain, Zahid Hussain Khand, Faheem Akhtar	PDF 3201-3211
Performance evaluation of hierarchical clustering protocols with fuzzy C-means Hamid Barkouk, El Mokhtar En-Naimi, Aziz Mahboub	PDF 3212-3221
An FPGA-based network system with service-uninterrupted remote functional update Tze Hon Tan, Chia Yee Ooi, Muhammad Nadzir Marsono	PDF 3222-3228
Prediction of nodes mobility in 3-D space Mohammad Al-Hattab, Nuha Hamada	PDF 3229-3240
A novel fast time jamming analysis transmission selection technique for radar systems Kamal Hussein, Mohamed Mabrouk, Bahaaeldin M. F. Elsor, Ahmed Alieidin, Walid M. Saad	PDF 3241-3254
Collaborative intrusion detection networks with multi-hop clustering for internet of things Ida Wahidah, Yudha Purwanto, Aditya Kurniawan	PDF 3255-3266
Residential access control system using QR code and the IoT Pak Satanaaowapak, Witawat Kawseewal, Suchada Promlee, Anuwat Vilamat	PDF 3267-3274
Inter-cell interference mitigation using adaptive reduced power subframes in heterogeneous networks Mohammed I. Aal-nouman, Osamah Abdullah, Noor Qusay A. Al Shaikhli	PDF 3275-3284
A novel methodology for time-domain characterization of a full anechoic chamber for antennas measurements and exposure evaluation Chakib Taybi, Mohammed Anisse Moutaouekkil, Bachir Elmagroud, Abdelhak Ziyat	PDF 3285-3292
Performance analysis of OFDM-IM scheme under STO and CFO Suyoto Suyoto, Agus Subekti, Arief Suryadi Satyawan, Vita Awalia Mardiana, Nasrullah Armi, Dayat Kurniawan	PDF 3293-3299
IoT based on secure personal healthcare using RFID technology and steganography Haider Ali Khan, Raed Abdulla, Sathish Kumar Selvaperumal, Ammar Bathich	PDF 3300-3309
Design and development of handover simulator model in 5G cellular network Abdulkarem Basil Abdulkarem, Lukman Audah	PDF 3310-3318

Comparative analysis of short-term demand predicting models using ARIMA and deep learning	PDF
Halima Bousqaoui, Iliham Slimani, Said Achhab	3319-3328
Characterizing user behavior in online social networks: Analysis of the regular use of Facebook	PDF
Jaafar Idrais, Yassine El Moudene, Abderrahim Sabour	3329-3337
A new technology on translating Indonesian spoken language into Indonesian sign language system	PDF
Risky Aswi Ramadhani, I Ketut Gede Dharma Putra, Made Sudarma, Ida Ayu Dwi Giriantari	3338-3346
Companies' perception toward manufacturing execution systems	PDF
Adil Aramja, Oualid Kamach, Rachid Elmeziane	3347-3355
RescueAlert-an accident detection and rescue mechanism	PDF
Uttkarsh Kumar Singh, Sahil Yadav, Sonali Joshi, Stuti Singh, Kayalvizhi Jayavel	3356-3364
Advances in lane marking detection algorithms for all-weather conditions	PDF
Hadhrami Ab Ghani, Rosli Besar, Zamani Md Sani, Mohd Nazeri Kamaruddin, Syabeela Syahali, Atiqullah Mohamed Daud, Aerun Martin	3365-3373
A fully integrated violence detection system using CNN and LSTM	PDF

NI OPC server

PLC

ABSTRACT

This paper proposes an improved control and monitors between two different PLCs, the Mitsubishi, and Omron. The main advantage is interoperability and communication between both PLC. The use of NI OPC server as the software interface reached interoperability and communication. There were developed two field applications to test interoperability. Laboratory virtual instrument engineering workbench (LabVIEW) uses as the software application for creating the user interface to control and monitor. This improvement show OPC server technology solves data compatibility issue between different driver controller's and reducing development cost. Regardless of whether there are more than two different PLCs, it's enough to use the NI OPC server. So the benefit of the NI OPC server is not limited to two types of PLC used right now but can also use the other manufacturers. Besides, the improvement of the previous study is the use of the LabVIEW makes data from the OPC server displayed more realistic. The use of LabVIEW allows additional monitoring functions, one of which is LabVIEW vision. Data utilization becomes more flexible, and so it can use for more complex purposes. It is envisaged that this is very useful for Integrator engineer to implement this method in industrial automation.

1. INTRODUCTION

System integration requires a tremendous exertion, particularly for enormous scope infrastructures. All in all, these facilities include an immense number of devices and applications with various communication conventions. In a system that utilizes a few distinct devices and must exchange information, they should gather, break down, and show information from different devices utilizing various conventions. This assignment isn't simple. Each device driver requires software from its vendor. Changes in convention determinations bring about communication failure, and modifications must be made.

This problem must be solved when confronting the plan and systems integration of infrastructures under cutting edge draws near. The choice of communication interface to accomplish a successful interoperability and heterogeneity the executives is an extraordinary choice that truly influences perspectives, for example, financial costs, viability, expand-ability, security, and versatility [1]. In this sense, OLE-object linking embedded-for process control (OPC) proved as an effective communication middle-ware mainly in industrial application. OPC provides technology to support interoperability and heterogeneity in control and automation applications, mainly devoted to industrial manufacturing [2]. The so-called classic OPC was

developed by the industrial automation industry task force in 1996 to provide communication protocol for the personal computer-based software applications and automation hardware [3].

OPC, as a standard interface, can communicate between numerous data sources, including devices in a factory, laboratory equipment, and database. There are a large number of papers reporting OPC applications. Each one of them focuses on specific features, just to name some are hardware in the loop [4], remote laboratory [5-8], share workspace [9, 10], SCADA and PLC [11, 12], process control data acquisition and monitoring [13-17].

The new enhancements made in the automation of the industrial processes were realized through integration among OPC PLC and LabVIEW. The OPC provides open connectivity meanwhile, PLC from the different manufacturers can communicate, and LabVIEW provides the user interface so the operator can easily control and monitor the applications system. Just to mention some previous works of the integration among OPC PLC and LabVIEW are [18-23]. Despite the numerous works carried out on the same subject, none investigated the interoperability and connectivity between two PLC different protocols or manufacturers.

This paper provides system control and monitoring between two different PLCs using OPC and LabVIEW. The current study contributes to the knowledge expansion in this field by addressing process control available in communication between Mitsubishi and Omron PLC based on OPC technology and LabVIEW user interface. The organization of the paper is as follows. The method of communication between two PLC different protocols (Mitsubishi and Omron) using NI-OPC server and LabVIEW explain in section 2. The result and discussion of this study provide in section 3 and section 4, respectively. In section 5 gives a sum of the conclusion.

2. METHOD

The primary commitment of the current work was the upgrade of interoperability and connectivity between two PLC various protocols and vendors, in view of OPC and LabVIEW. The experimental work was designed and set up among the sequence of NI-OPC server, PLC, and LabVIEW. Table 1 gives the exposed experiment pointing out the field application system, the OPC role, the software involved for both client and server, and the hardware appliances.

Table 1. The experimental OPC-based systems developed

Field application system	OPC role	OPC server	OPC client	Hardware
Bottle Unscrambling	Control & monitoring, Interface connectivity	NI OPC server	LabVIEW	Mitsubishi PLC FX3U, Windows-based PC
Bottle Filling	Control & monitoring, Interface connectivity	NI OPC server	LabVIEW	Omron PLC CP1E, Windows-based PC

2.1. NI-OPC server and LabVIEW

The utilization of the OPC interface prompted by demand of using PLC Mitsubishi and Omron also the SCADA system established in LabVIEW. Thanks to the proficiency of the OPC, their integration was easy and effective. Such systems reveal the OPC standard as an effective tool of integration of networks of controllers, sensors, and instruments regardless of the automated process. As a rule, the capacity of an OPC is to get to the information of a field device and make them available to OPC clients, i.e., programming applications that speak to activities with such information. In this work, the NI OPC server 2013 is utilized to set up an OPC server. To do this, among other parameters to be enumerated, the used addressed in the PLC memory the format of the data and the type of access. A PC, with OS Windows 10 Professional and Intel i3 CPU, pursues as the hosting of the NI-OPC server 2013, the LabVIEW 2015 application, and the software for the configuration of the PLC.

National instruments LabVIEW package is a powerful graphical language with an impressive built-in function. LabVIEW 2015 utilized to configure the virtual instrument (VI) as the OPC Client of the OPC server depicted formerly. The variables transferred by such an OPC Server added to the library of a VI, so controls and indicators connected to them. Indicators related with signals that read from the PLC, controls used to create variables to the PLC [8]. Accordingly, the collected values available for operations commanded from the LabVIEW Front panel, then imported the controls and indicators. The LabVIEW connector element is required, so it has to be continued and configured in the LabVIEW front panel. The NI-OPC server published the controls and indicators of the VI, then the LabVIEW connector ready to import and link them to the corresponding variables in the LabVIEW front panel. By this path, the instructions renewed those controls and indicators. The selection of LabVIEW is not only intended to facilitate data visualization but also because of the additional functions, one of which is LabVIEW vision. LabVIEW vision can be used to

inspect field applications, such as detecting the presence or absence of labels and bottle caps. In general, the LabVIEW vision works by comparing the images taken by the camera with the images used as template patterns. LabVIEW vision will output the similarity level of the two images. By setting the similarity level limit, an application will be generated that can detect the presence or absence of certain parts of the field application. All image processing features are provided. Users don't need to do complicated programming, just take the desired feature (in the form of an icon), and add it to the image. The results obtained by adding these features are also shown on the screen so that users can adjust the results according to what they want [24].

2.2. PLC and field application

In signal management relate to the PLC's digital input and output ports, sensors and actuators were exploited to acquire signals in the automation process. Such PLC controlled the field application. The Omron controlled the bottle filling process, and Mitsubishi controlled the bottle unscrambling process. Each PLC has software from its manufacturer, Omron-CP1E used CX-Programmer and Mitsubishi-FX3U used GXWork2.

Both field applications were connected to the PC using a USB cable. The connection between PLC and OPC server used the RS232 Serial. The PLC was configured as a new OPC to communicate with the NI-OPC server. This leads to adding client access to the server. The Path makes a chance for OPC Client to access all PLC registers. In the LabVIEW, a VI created to connect OPC server [23].

2.3. Proposed architecture

Figure 1 brings the block diagram of the system exploited the interconnection between two different PLC protocols. OPC technology is utilized in this situation using NI-OPC server and augmented the benefit of LabVIEW as a control and monitoring system function. Interconnection between Mitsubishi FX3U and Omron CP1E is made feasible by the role of the NI-OPC server without the need to synchronize the two controllers or contribute each protocol from the respective vendors.

The experimentation setup for controlling and monitoring of two different PLCs OPC based was proposed as shown in Figure 2. This work used two field applications, namely bottle unscrambling and bottle filling. Both of the field applications can communicate through NI-OPC server with some variable settings. Through these arrangements, the filling water process will happen if bottles delivered from the bottle unscrambling process have aligned to with position the bottle's head is above. This data got since the bottle filling controller read data from sensors as a result of the presence detection of the bottles sent from the bottle unscrambling process. Meanwhile, the bottle unscrambling process suspend if the bottles queuing on the bottle filling process is full, and it will reactivate if the queue reduced or depend on the PLC program [25].

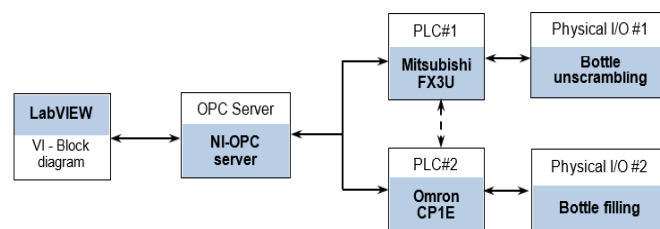

Figure 1. Block diagram of the proposed architecture

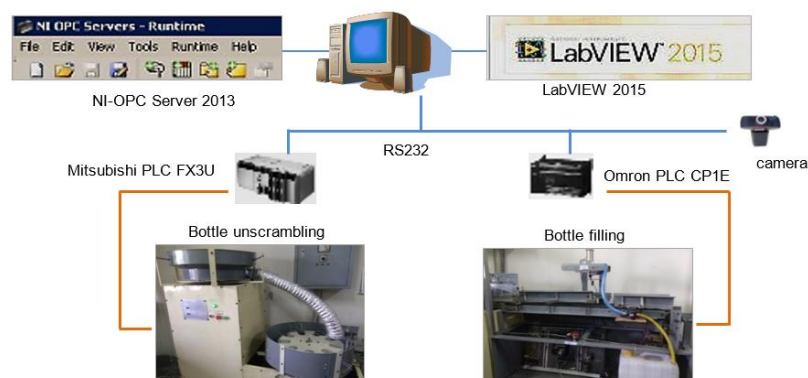

Figure 2. Experimentation setup of the control and monitor two-PLC based on OPC

3. RESULTS

In the OPC standard, this client-server communication is the significant key of the entire framework. The client application is not associated with device management. The server application is answerable for dealing with the device utilizing a standard interface. Equipment suppliers and programming designers can emerge from different vendors. LabVIEW gives two answers for associating OPC clients to the OPC framework: i) Running LabVIEW DataSocket in the LabVIEW advancement framework, ii) Running the LabVIEW DSC module. This work embraces the principal answer for making a thing of OPC Client. By utilizing the front panel information joining capacity, objects (buttons, indicators, and so forth) can be connected to things in the OPC server through the DataSocket server. Subsequently, the trial procedure control in the LabVIEW application is made through the element item, which is designed on the server. Figure 3 outlines the nearby OPC framework utilized for communication between LabVIEW and PLC applications. The PLC communicates with the OPC server through the Serial port. At the point when the OPC server gets PLC information through the Serial port, the information is changed over to a standard OPC position that can be gotten to by the OPC client. OPC client can understand information and compose new information to the device by utilizing OPC server [26]. In this work, the names of NI OPC server tags were set up, following the input-output made on the Mitsubishi and Omron PLC programs. The first is the procedure for how to set up communication on the NI-OPC server, and then the second is the procedure for how to communicate between LabVIEW and the NI-OPC server.

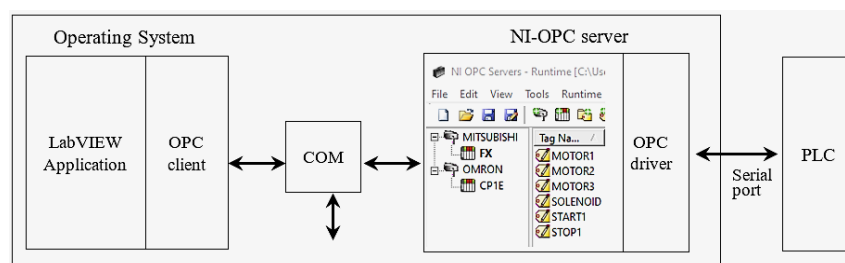

Figure 3. OPC for communication between LabVIEW and PLC

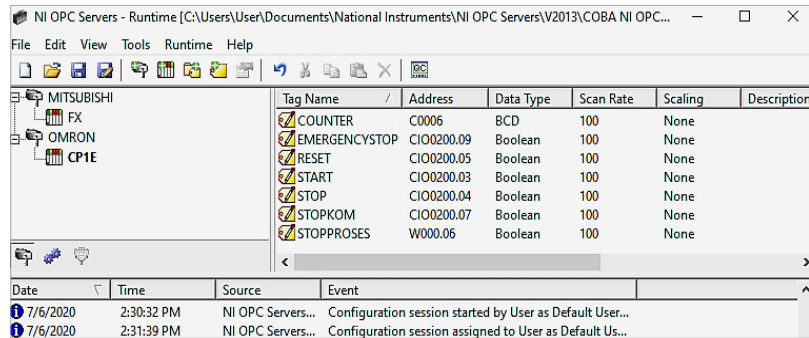

3.1. Steps for communication settings on NI-OPC server

The steps for communication settings on the NI-OPC server are as:

- Open NI-OPC server 2015.
- Since there are two PLC connected, create 2 channels on the NI-OPC server. Name both channels according to the PLC name.
- Add to each channel the type of PLC model used. For Mitsubishi PLC type “FX” and for Omron PLC type “CP1E”.
- Add a tag to each type of PLC according to the input-output device connected to it. For Mitsubishi PLC add six tags, namely “Motor1”, “Motor2”, “Motor3”, “Solenoid”, “Start1” and “Stop1” as shown in Figure 4. For Omron PLC add seven tags, namely “Counter”, “EmergencyStop”, “Reset”, “Start”, “Stop”, “StopKom” and “StopProses” as shown in Figure 5.

Tag Name	Address	Data Type	Scan Rate	Scaling	Description
MOTOR1	M0006	Boolean	100	None	
MOTOR2	M0007	Boolean	100	None	
MOTOR3	M0008	Boolean	100	None	
SOLENOID	M0010	Boolean	100	None	
START1	M0001	Boolean	100	None	
STOP1	M0002	Boolean	100	None	

Figure 4. Six tags correspond to the I/O devices connected to the Mitsubishi PLC FX3U

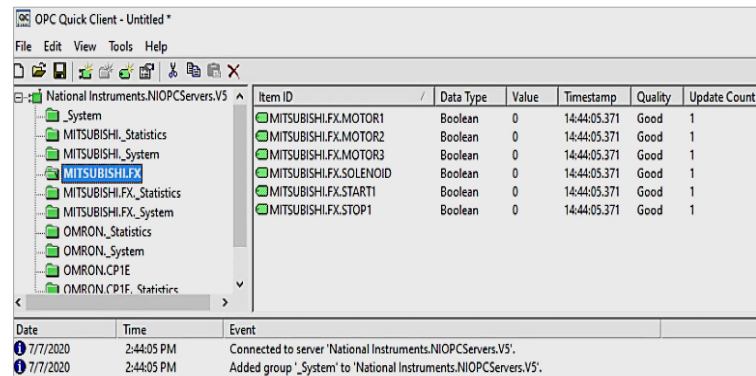

Tag Name	Address	Data Type	Scan Rate	Scaling	Description
COUNTER	C0006	BCD	100	None	
EMERGENCYSTOP	CIO0200.09	Boolean	100	None	
RESET	CIO0200.05	Boolean	100	None	
START	CIO0200.03	Boolean	100	None	
STOP	CIO0200.04	Boolean	100	None	
STOPKOM	CIO0200.07	Boolean	100	None	
STOPPROSES	W000.06	Boolean	100	None

Figure 5. Seven tags correspond to I/O devices connected to the Omron PLC CP1E

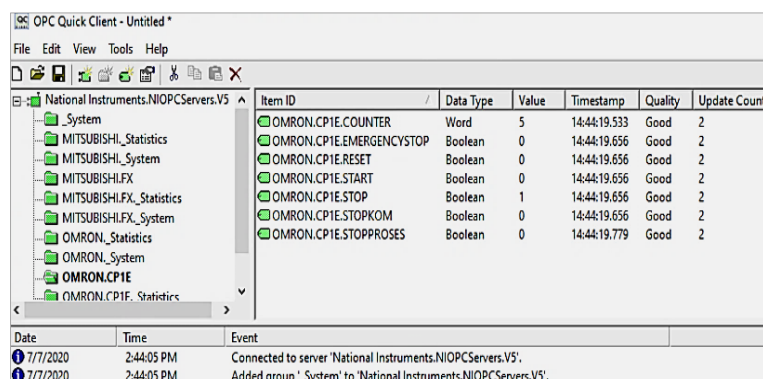

- Run “*OPC Quick Client*”. In the “*OPC Quick Client*” window, select the “*Mitsubishi.FX*” folder as shown in Figure 6. If the connection and driver selection are correct then the quality column on all tags will display the status “*Good*”. Likewise, for the “*Omron.CP1E*” folder the quality column in all tags should display the status “*Good*” as shown in Figure 7.

Item ID	Data Type	Value	Timestamp	Quality	Update Count
MITSUBISHI.FX.MOTOR1	Boolean	0	14:44:05.371	Good	1
MITSUBISHI.FX.MOTOR2	Boolean	0	14:44:05.371	Good	1
MITSUBISHI.FX.MOTOR3	Boolean	0	14:44:05.371	Good	1
MITSUBISHI.FX.SOLENOID	Boolean	0	14:44:05.371	Good	1
MITSUBISHI.FX.START1	Boolean	0	14:44:05.371	Good	1
MITSUBISHI.FX.STOP1	Boolean	0	14:44:05.371	Good	1

7/7/2020	2:44:05 PM	Added group 'System' to 'National Instruments.NIOPCServers.V5'.

Figure 6. The OPC quick client shows the status of all tags from Mitsubishi FX is good

Item ID	Data Type	Value	Timestamp	Quality	Update Count
OMRON.CP1E.COUNTER	Word	5	14:44:19.533	Good	2
OMRON.CP1E.EMERGENCYSTOP	Boolean	0	14:44:19.656	Good	2
OMRON.CP1E.RESET	Boolean	0	14:44:19.656	Good	2
OMRON.CP1E.START	Boolean	0	14:44:19.656	Good	2
OMRON.CP1E.STOP	Boolean	1	14:44:19.656	Good	2
OMRON.CP1E.STOPKOM	Boolean	0	14:44:19.656	Good	2
OMRON.CP1E.STOPPROSES	Boolean	0	14:44:19.779	Good	2

Date	Time	Event
7/7/2020	2:44:05 PM	Connected to server 'National Instruments.NIOPCServers.V5'.
7/7/2020	2:44:05 PM	Added group 'System' to 'National Instruments.NIOPCServers.V5'.

Figure 7. The OPC quick client shows the status of all tags from Omron CP1E is good

3.2. Steps to connect LabVIEW with NI-OPC server

The steps for connecting LabVIEW with NI-OPC server are as follows:

- Create a “*new project*” on LabVIEW.
- In the “*new project*” window, right-click on “*My Computer*” then select “*New*” - “*I/O Server*” as shown in Figure 8.
- In the “*Create New I/O Server*” window, select “*OPC Client*” then click “*Continue*”

- In the “*OPC Server list*” select “*National Instruments.NIOPCServers.V5*”
- In the “*new project*” window, right-click on “*OPC1 object*” and select “*Create New Bound*” to create a variable in LabVIEW that corresponds to all the tags on NI OPC server. For tags Mitsubishi, go to “*OPC1-Mitsubishi-FX*” shown in Figure 9. For tags Omron, go to “*OPC1-Omron-CPIE*” as shown in Figure 10. Select all the tags and then click “*Add*” button to create variables for them in LabVIEW. The variable with the same name as the tags will appear under the *OPC1* folder in the *New Project* window.
- The next step is to display the variable data and process it in the LabVIEW program as shown in Figures 11 and 12.

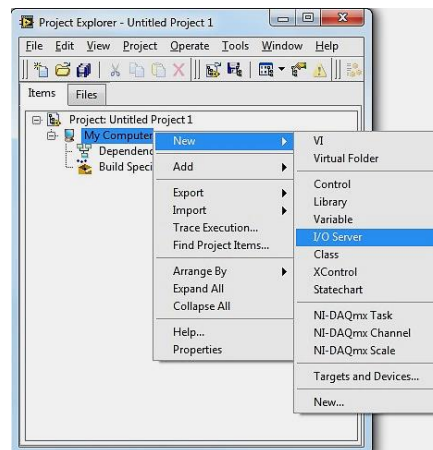

Figure 8. Connecting LabVIEW with NI-OPC server through I/O server

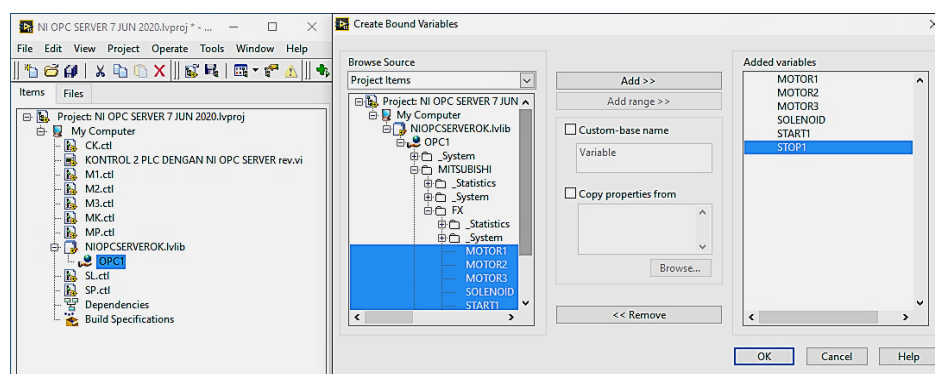

Figure 9. Creating variables associated with all Mitsubishi PLC tags on the NI OPC server

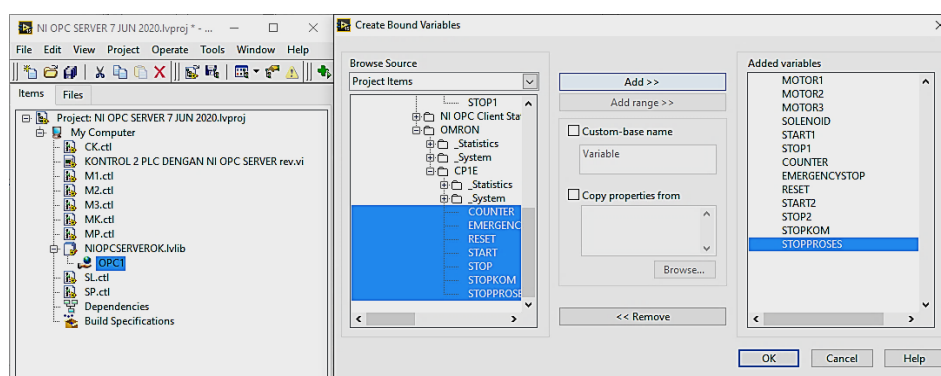

Figure 10. Creating variables associated with all Omron PLC tags on the NI OPC server

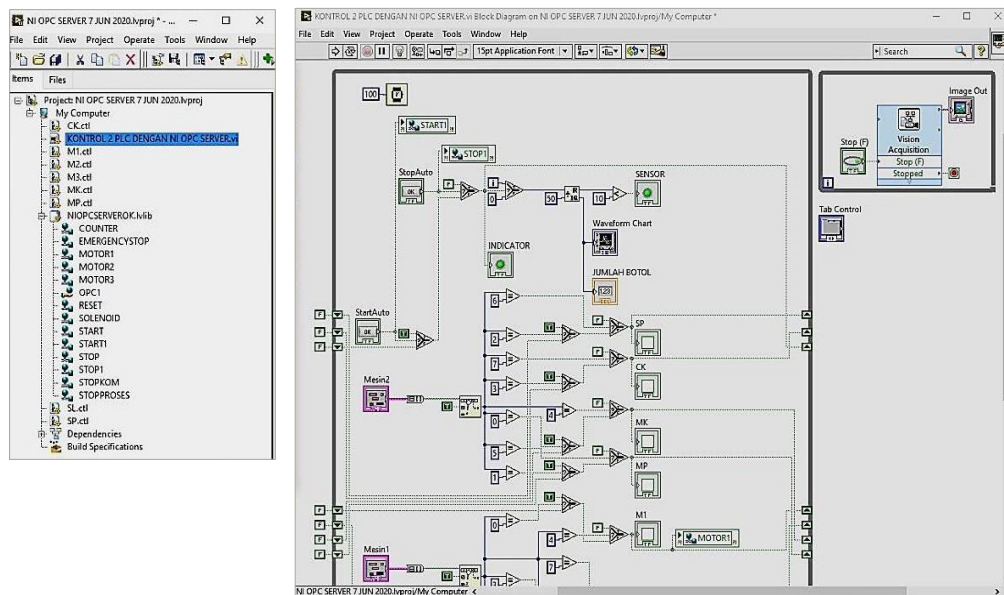

Figure 11. Variables data associated with OPC tags in the LabVIEW

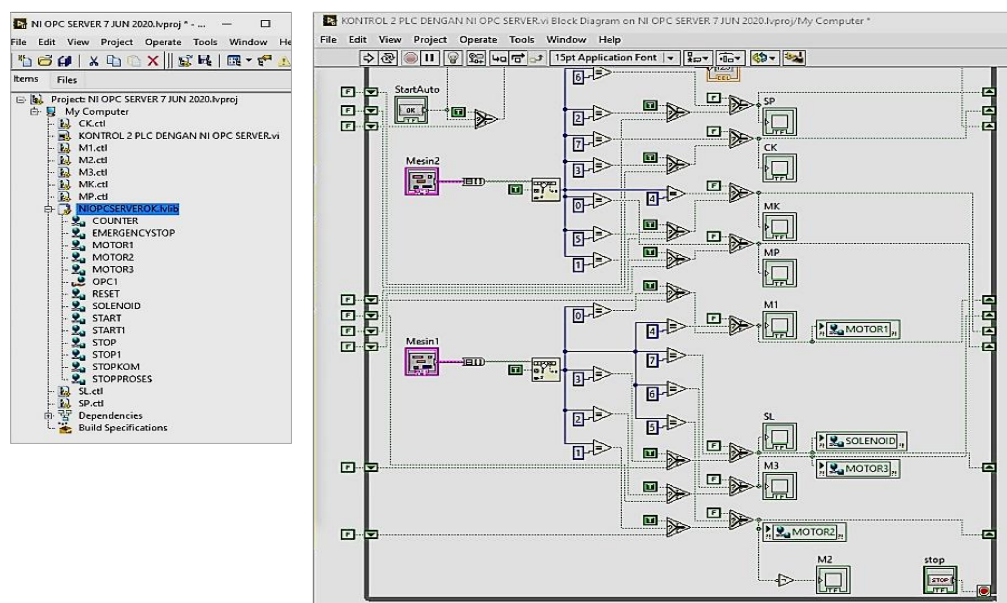

Figure 12. Variables data associated with the OPC server tag in the LabVIEW

As a result, monitoring and controlling of two PLCs became easy by using NI-OPC server and LabVIEW. In the NI OPC server there is a facility for setting or selecting various PLC drivers start from Allen Bradley, Beckhoff, GE, Honeywell, Mitsubishi, Omron, Siemens, Telemecanique, Toshiba. So that the efficacy of the NI OPC server is not only limited to the two types of PLC used in this paper. In addition, the improvement from the previous study is data from OPC server can be displayed and visualized more realistically using the LabVIEW program; and data utilization becomes more flexible which can be used for more complex purposes as shown in Figure 13. In this work, the bottle cap detection application has implemented using LabVIEW Vision and a webcam. By using LabVIEW vision, we can monitor workpieces and even labels; so that monitoring can cover all aspects, not only counting the quantity but also the condition of the product. Figure 14 shows that LabVIEW Vision will be able to detect the bottle cap if there is a manual bottle cap feeding process.

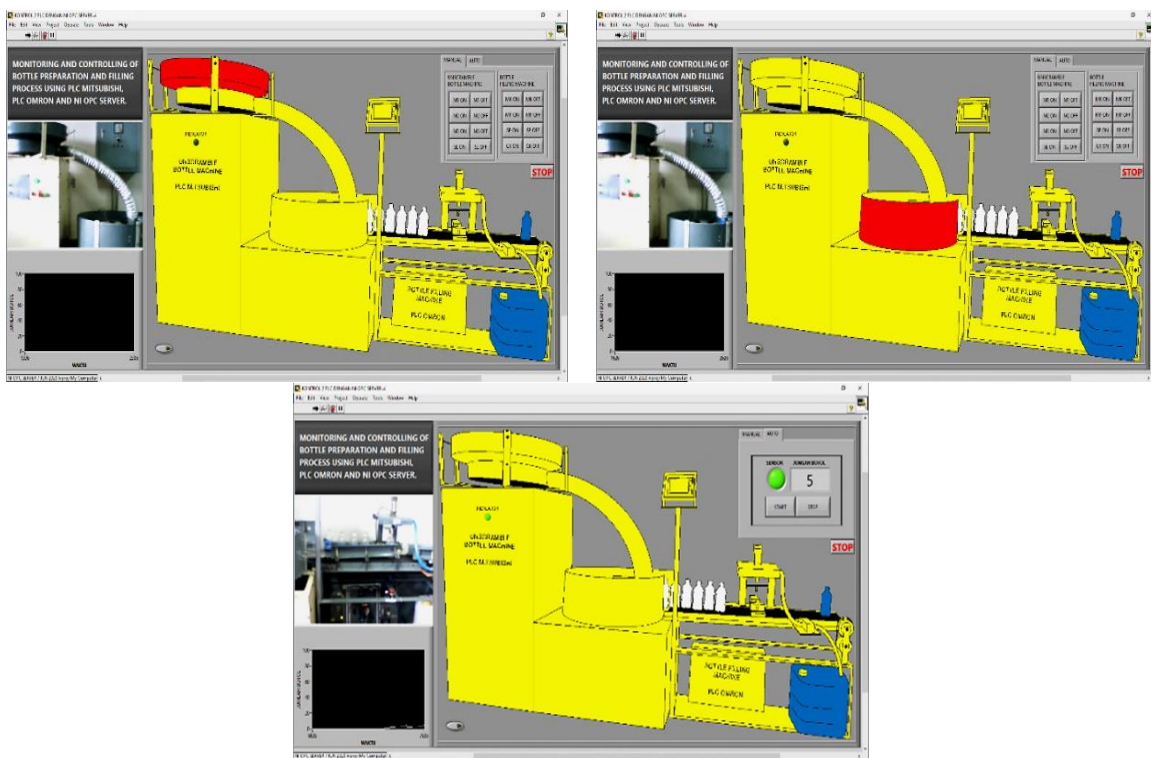

Figure 13. The result of display in LabVIEW according to the actual physical conditions on the field application

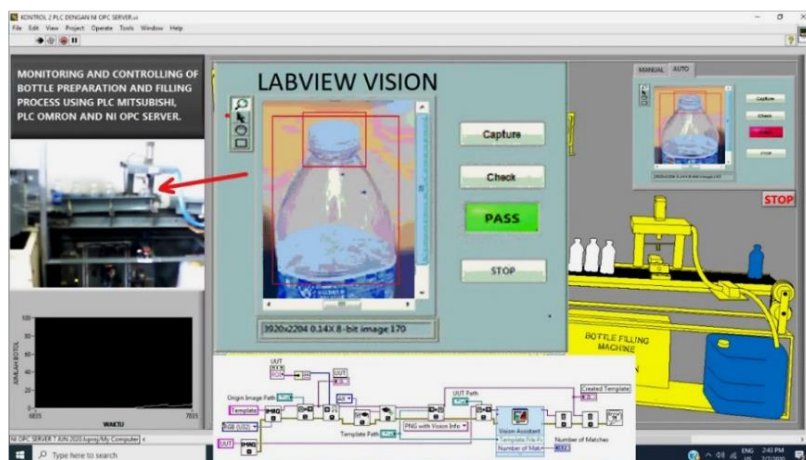

Figure 14. The LabVIEW vision application display for bottle cap detection

4. DISCUSSION

In several previous papers have discussed the use of OPC server. All references in this work using the OPC server for data acquisition and interconnection between different controllers. These references use the PLC as a controller, but none are from different manufacturers. There is a reference [27] using two PLCs, but it comes from one manufacturer. Therefore, the use of OPC server has become less exposed. Solely reference [25] indeed used two different PLC types, but having a limitation in the client program not upheld by the user interface to control and monitor quickly. In any case, this was better than simply applying a PLC to perform the heterogeneity and interconnectivity in control and automation applications. Table 2 provides some related works heretofore, with its focus on the type of OPC software used, the type of protocol communication used, and the hardware used.

Table 2. Selected papers of the related works

Related works [ref.]	OPC software	Communication protocol	Hardware (PLC)
González I <i>et al.</i> [8]	NI-OPC server LabVIEW, JIL (client)	Ethernet/PROFINET	Siemens S7-1200
Şahin C. and Bolat E. D. [19]	OPC server Delphi (client)	RS232 ASP-Internet	Siemens S7-200
Lakshmi S. A <i>et al.</i> [23]	RSView 32 SCADA	RSLink-TCP/IP	Micrologix-1200 Mitsubishi FX3U
Pranowo I. D <i>et al.</i> [25]	KEPServerEx6	RS232	Omron CP1E
Aleksandrov S <i>et al.</i> [27]	OPC Easy server LabVIEW (client)	LAN-TCP/IP	Festo FC-34 Festo FC-640
Nithyarani N. [28]	NI-OPC server LabVIEW (client)	Ethernet-TPC/IP	Honeywell HC900-C30
This work	NI-OPC server LabVIEW (client)	RS232	Mitsubishi FX3U Omron CP1E

Figure 13 approved that the improved control and monitoring between two PLC different protocols using NI-OPC server and LabVIEW user interface can be done. The developed control and monitoring system has two selection modes, namely the manual and the automatic. In automatic mode, when the Start button is squeezed, the system will run consistently starting from the bottle adjusting process until the bottle filling process and stop only when the Stop button is squeezed. This can happen due to the capacity of the NI-OPC server as a scaffold for the two PLC with various protocols, so they can impart without paying attention to the drivers of the two software.

In accordance with the title of this paper, the tools for improving control and monitor here is not only using NI-OPC but also using LabVIEW software. LabVIEW software was chosen because this software provides strong support and easy connection with various hardware devices. With many additional features in LabVIEW, one of which is LabVIEW Vision, it allows a lot of development to be done. In this study, the LabVIEW Vision and a webcam have implemented to detect the bottle cap. In addition, the LabVIEW graphical programming language makes it easier to implement the program even for inexperienced. This is the idea proposed in this paper.

5. CONCLUSION

The goal of this work proposes an improved control and monitors between two PLC various controllers in the modern manufacturing process. This study has successfully exhibited the strength of the NI-OPC server in communicating two different PLC protocols particularly between Mitsubishi FX3U and Omron CP1E. This work has been boosted an advantage in controlling and monitoring through the functions contributed by the LabVIEW user interface. In this work, the use of two different PLC Mitsubishi FX3U and Omron CP1E contributes a precise figure of the benefits of OPC server technology. What has become an improvement from previous work is the more realistic OPC tag data visualization and more flexible data utilization using LabVIEW. Also, the use of LabVIEW allows the addition of many controls and monitoring features, one of which is LabVIEW vision, which can perform inspection functions on the field application. Because of the utilization of NI-OPC server and LabVIEW, the advancement cost investment funds in the modern manufacturing process will be more proficient. Say if, for two different types of PLC manufacturers can be handled by the software interface, namely NI-OPC server. If there are more than two, it is sufficient to utilize the software. So, it is an outstandingly away from the level of the venture finances will be gotten. In spite of field application was a prototype, but this work used the PLC as a genuine industrial device on automation. Further work ought to be done, structure up the web base, so the communication among the controllers can be observed and controlled remotely.
