### SCOPE

E3S Web of Conferences is an Open Access publication series dedicated to archiving conference proceedings in all areas related to Environment, Energy and Earth Sciences. The journal covers the technological and scientific aspects as well as social and economic matters. Major disciplines include: soil sciences, hydrology, oceanography, climatology, geology, geography, energy engineering (production, distribution and storage), renewable energy, sustainable development, natural resources management... E3S Web of Conferences offers a wide range of services from the organization of the submission of conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference papers. Proceedings are published under the scientific responsibility of the conference editors.

This conference procceding contains a collection of high quality papers.

Why not reconsidering it by SCOPUS ?

reply

Melanie Ortiz 1 year ago

SCImago Team

Dear Ali,

thank you very much for your comment, unfortunately we cannot help you with your request. We suggest you contact Scopus support: https://service.elsevier.com /app/answers/detail/a\_id/14883/kw/scimago/supporthub/scopus/ Best Regards, SCImago Team

E

Elisa Julianti 1 year ago

Hello,

This Conference Proceeding is having more number of quality manuscript and many more funded article.

Please consider it for scopus.

K reply

Melanie Ortiz 1 year ago

SCImago Team

Nurhadi 1 year ago

Dear Scimago Team.

Is it possible for me to submit my articles in the E3S Web of Conferences to a journal with the index Q1/Q2/Q3/Q4, and does it not violate plagiarism? Thank you.

Dear Elisa, thanks for your participation! Best Regards, SCImago Team

reply

Sarah Pham 12 months ago

Dear Nurhadi,

I have the same question as yours. My paper was published in e3s in 2020 when it was still schopus listed (Q3). Now it has been out listed. SO I WANt to find another Schopus listed papers to submit my e3s paper. I wonder what the answer you received from E3S or other related authorities? Thanks

Melanie Ortiz 1 year ago

Dear Nurhadi,

thank you very much for your comment.

We suggest you contact E3S Web of Conferences editorial staff so they could inform you more deeply concerning the copyright. Besides, you'll need to check the editorial policy of the journal you'll choose and inform the editorial staff. Best Regards, SCImago Team

Т

Dear SCImago Team

Could you tell me the E3S Web of Conferences belongs to the blacklist journals or not? Because I got some information from my college. Please advise

Thank you very much

🔶 reply

Melanie Ortiz 3 years ago

SCImago Team

mago Te

Thank you for contacting us.

Dear TheHung,

SJR is a portal with scientometric indicators of journals indexed in Scopus. All the data have been provided by Scopus /Elsevier and SCImago doesn't have the authority over this data. For more information about predatory journals or publishers, you can check the link below:

https://beallslist.weebly.com/

Best regards, SCImago Team

Antonietta lanniello 3 years ago

Dear SCImago Team

Could you please advise whether E3S Web of Conferences has an impact factor? Because in internet I saw that this journal has 0.52 IF. Please advise

Thank you very much

reply

Melanie Ortiz 3 years ago

SCImago Team

Dear Antonietta, thank you very much for your comment. SCImago Journal and Country Rank uses Scopus data, our impact indicator is the SJR. We suggest you consult the Journal Citation Report for other indicators (like Impact Factor) with a Web of Science data source. Best Regards, SCImago Team

Ezhil 3 years ago

Dear SCImago Team

E3 web of conferences journal Coverage mentioned is 2013-2020. Will it be extended.

Melanie Ortiz 3 years ago

Dear Ezhil,

thank you very much for your comment, unfortunately we cannot help you with your request. We suggest you contact Scopus support: https://service.elsevier.com /app/answers/detail/a\_id/14883/kw/scimago/supporthub/scopus/ Best Regards, SCImago Team

Sirinen

Siripen 3 years ago

Dear SCImago Team

Could youn please advise whether E3S Web of Conferences is a journal? What category it is called? Is it a conference proceedings or journal? Because in E3S Web of Conferences, it says it is a journal but in scopus, it is a conference proceedings. Please advise

Thank you very much

reply

Tag 3 years ago

It's not a journal, it is Conferences Proceedings.

Elena 3 years ago

currently the quartile of this journal is 3

Dear Elena,

reply

Melanie Ortiz 3 years ago

SCImago Team

Thank you for contacting us. This publication type hasn't a quartile assigned. We calculate the SJR data for all the publication types, but the Quartile data are only calculated for Journal type's publications. Best regards, SCImago Team

Madhuri Damaraju 5 years ago

Hi,

# **Preface IC-AMME**

The 1<sup>st</sup> International Conference on Automotive, Manufacturing, and Mechanical Engineering (IC-AMME 2018) has been organized by Mechanical Engineering Department and Continuing Education Center, Petra Christian University, Surabaya, Indonesia. This event was held on September 26–28, 2018 in Bali, Indonesia. As an effort to contribute in distributing research outcomes especially to search for alternative energy and more efficient equipment and machines.

IC-AMME 2018 presented three international honorable keynote speakers from representative countries: 1) Prof. Béla Pukánszky, Budapest University of Technology and Economics, Budapest, Hungary; 2) Prof. Sunaryo, University of Indonesia, Jakarta, Indonesia; and 3) Prof. Walter L. Bradley, Distinguished Professor Emiritus of Mechanical Engineering, Baylor University, Texas, USA (2012), Professor Emeritus of Mechanical Engineering, Texas A&M University, Texas, USA (2000). To reach a broader network of researchers, this event selected local researchers and overseas fellows to share their best research works in this conference. Over 100 representatives from 51 institutions participated in this event, involving more than 80 abstracts submitted. After a rigorous selection process, the Scientific & Editorial Board decided to publish 42 papers in E3S Web of Conferences, an open-access proceedings in environment, energy and earth sciences, managed by EDP Sciences, Paris, and indexed on Scopus, Scimago, Conference Proceedings Citation Index-Science (CPCI-S) of Clarivate Analytics's Web of Science, DOAJ (Directory of Open Access Journals) and the like.

Of 42 selected papers, 27 papers were the result of joint researches between Indonesia and various countries such as Australia, England, Germany, Japan, Lithuania, Malaysia, Nigeria, Republic of China, the Republic of Korea, Republic of Singapore, Sweden, and United States of America. Each of the 42 papers in E3S Web of Conferences was reviewed by at least two experts using the double-blind system. The published papers have passed all necessary improvement requirements in accordance to the Web of Conferences standard, reviewer's comments, SI (*Système International d'Unités*), similarity tests by Turnitin program (with the highest threshold of 20 %), 90 % of references must be at least dated from 15 years, and reflected on Google, as well as editing procedure by professional editors from seven countries (Georgia, India, Indonesia, Latvia, Lithuania, Malaysia, and Sweden).

We would like to express our gratitude to the official committee, scientific & editorial boards, and organizing partners. Special thanks as well to our co-host partners: University of Indonesia, Binus University, Binus ASO School of Engineering, Sebelas Maret University, Tarumanegara University, and *Badan Kerja Sama Teknik Mesin Indonesia* (Indonesian Mechanical Engineering Cooperation Agency) for trusting and supporting this conference.

Finally, we would like to briefly thank all presenters and attendees for their participations to share the wonderful ideas and take creative decision to inspire further research and exchange scientific reason. We hope this time, all papers can be compiled into scientific works as first publication of the 2018 IC-AMME. Lastly, we hope that this conference encourage further research collaboration. Also, everyone should be proud of this result.

Assoc. Prof. Dr. Didik Wahjudi Conference Chair

Editor in Chief: Roy Hendroko Setyobudi (Malang, IDN)

> Abstract. In this study, a Monte Carlo method (MCM) was applied on the fatigue crack growth rate (FCGR) curves to evaluate a probabilistic assessment for the welded longitudinal Al 6013-T4 aluminum alloy under various post-weld heat treatment (PWHT) conditions. The welded CT specimens were manufactured by a tungsten inert gas (TIG) welding, and the fatigue crack growth (FCG) tests were conducted by following ASTM E647. Before conducting the FCG test, the PWHT conditions were applied to the welded CT specimens under three different aging times of 6 h, 18 h, and 24 h at 175 °C. The FCGR curves were generated from the FCG data and plotted on the da/dN versus  $\Delta k$  curves. The constants C and m were determined by drawing the fitting line on the FCGR curves. A sizeable random number was generated from the obtained constants by MCM. By plotting these constants, the probabilistic assessment of FCGR was determined on the da/dN versus  $\Delta k$  curves. The results showed that the confidence interval was appeared on the FCGR curves and limited by the upper and lower probabilistic lines. It was found that the lower and upper probabilistic lines were formed at 1 % and 90 %, respectively.

> **Key words:** Lognormal distribution method, Monte Carlo method, Paris's equation.

### 1 Introduction

For particular aluminum alloy series, the 6xxx series is mostly used for the components in the aircraft due to their superior characteristics such as high mechanical and fatigue strength, good formability and weldability, and good corrosion resistance [1–3]. The 6xxx series can be found mainly on the structural components in the aircraft, such as for the fuselage skins. The welding method becomes the most straightforward and economist ways for the manufacturing process. It has been reported that the gas metal arc welding (GMAW) and tungsten inert gas (TIG) was the conventional welding methods used for joining

process in aluminum alloys [1]. The GMAW can be operated in the high welding speed with good penetration depth.

Furthermore, the welding process can be performed continuously regardless of the electrode usage for the limited length [4-5]. However, the problems such as melt through, distortion, etc., appears due to high heat input, especially for the aluminum with the particular thicknesses. The TIG welding tends to be preferred over the GMAW since it can perform the joining process well for the wide variety of metals and a wide range of workpiece thicknesses and shapes.

In general, the welding process will affect the mechanical properties of the welded area, even though the chosen welding method has good weldability. The weld metal (WM) and heat-affected zone (HAZ) areas tend to become harder and more fragile than the base metal (BM) area. The risk of hot cracking appearance may increase, and some properties such as toughness, ductility, fatigue strength, etc. may fall on a degradation [4, 6, 7]. It has been reported that those mechanical properties of the welded material can be improved by applying a post-weld heat treatment (PWHT) for a particular period and temperature [8, 9].

In the aircraft application, a fatigue crack growth (FCG) problem becomes one of the main concerns since most of the components experience a fluctuation load. An accurate assessment of a fatigue crack growth rate (FCGR) must be evaluated carefully for the design and safety requirements. Some difficulties were found when the assessment was only determined by a few data of the FCG test. The FCGR could not be predicted precisely due to the data deviation. Therefore, an approach method is needed to construct an accurate FCGR prediction from limited data of the FCG test.

In this study, the probabilistic assessment of FCGR for the welded longitudinal Al 6013-T4 aluminum alloy is investigated by a Monte Carlo method (MCM). The FCGR data was obtained from the FCG test by following the ASTM E647 under three different PWHT conditions. The probabilistic assessment is plotted on the da/dN versus  $\Delta k$  curves, and the results are discussed.

### 2 Experimental procedures

The chemical composition of the base metal Al 6013 aluminum alloy is listed in Table 1. The welded metal was manufactured by TIG welding process in a longitudinal direction, as shown in Figure 1. The welded metal was in the plate form with 2.5 mm of thickness. The electrode wire of Al 5356 was used as filler with the 3.2 mm of diameter.

Materials	Si	Fe	Cu	Mn	Mg	Cr	Zn	Ti	Al
Al 6013 T4	0.66	0.09	0.80	0.39	1.04	0.07	0.06	0.02	Bal.

Table 1. The chemical composition of the Al 6013 aluminum alloy (wt.%).

E3S Web of Conferences **130**, 01016 (2019) *IC-AMME 2018* 

Fig. 1. The welded plate by TIG on the longitudinal direction.

The contamination during the welding process was prevented by applying a shielding gas of ultra-high purity (UHP) of 99.95 % *Argon* (Ar). The TIG process was conducted by following the welding parameters as follows:

1.	Polarity	: DCEP
ii.	Welding speed	$: 2.5 \text{ mm s}^{-1}$
iii.	Voltage	: 15 V
iv.	Current	: 70 A
v.	Gas flow rate	: 15 L min <sup>-1</sup>
vi.	Aging temperature	:175 °C
	T1	(CT)

The compact tension (CT) specimen was used for the FCG test. The CT specimens were manufactured from the welded plate with the dimensions of 300 mm  $\times$  100 mm  $\times$  2.5 mm and 12 mm of the initial crack length, as shown in Figure 2. The initial crack was made by using an electric discharge machine (EDM). The FCG tests were conducted by following the ASTM E647 standard, and the CT specimens were initially heat-treated by solution heat-treated (t4) method. The CT specimens were initially heated at 425 °C for two h, and then the cold work was applied to the specimen to produce 2 % strain hardening. Further, three different aging times of 6 h, 18 h, and 24 h were applied at 175 °C.

The MCM was applied to determine the probabilistic assessment on the FCGR curve. This method involves a large random number to generate a prediction calculation from a particular set of constants in the FCGR Equation. The set of constants consist of C and m that is known as material constants in Paris's Equation. The Equation is formulated as follows:

$$\frac{da}{dN} = C(\Delta K)^m \tag{1},$$

where da/dN is the fatigue crack growth rate (mm/cycles) and  $\Delta k$  is the stress intensity factor (MPa m<sup>1/2</sup>).

### **3 Results and discussion**

Figure 3 shows the FCGR curves of the welded Al 6013-T4 under three different aging times. A regression line is fitted on the combined curves by a linear square fitting method (LSFM). Paris's Equation is applied on the fitted line, and the constants C and m are obtained. The obtained constants C and m are 7.71E-15 and 8.03, respectively. The LSFM is also applied to each aging time curve, and the constant values of C and m for each curve are summarized in Table 2. It is shown that m exponent slightly reduces at 18 h. It has been reported that m exponent corresponded to the FCGR resistance [1]. The FCGR resistance will decrease with a decrease in m exponent value.

The combined curve constants show a significant difference with the obtained constants in Table 2. Since the LSFM is easily influenced by the number of data scattering on the FCG data points, the LSFM on the combined curve tends to result in a deviation. As a result, the constants C and m are higher than the values in Table 2. In this study, the constants C and m are based on the values in Table 2. The average value is determined by evaluating from the probability graph, as shown in Figure 4. The 50 % probability and standard deviation of each constant are obtained by applying the lognormal distribution method (LDM). The values of each constant are summarized in Table 3.

Figure 5 shows a large random number of constants *C* and *m* generated by MCM. The random number is produced about 30 000 data points. This random number is generated by applying random variables on a standard normal distribution. This method was first time proposed by Box and Muller and had been previously applied to determine a probabilistic assessment of creep crack growth rate (CCGR) for Gr.91 steel [10]. The MCM has been reported as a method that was successful in predicting the CCGR from limited data of creep crack growth (CCG). Figure 6 shows the confidence interval limited by the upper and lower probabilistic lines on FCGR curve. The confidence interval corresponded to the rational/non-rational prediction for the fastest and lowest of FCGR. Figure 6 it is shown that the lower and upper probabilistic lines for welded Al 6013-T4 were formed at 1%

and 90 %. 1 % and 90 % are determined since these values can cover all of the experimental data. The 1 % probability line is determined as the non-rational prediction, while the 90 % probability line is determined as the rational prediction.

### 4 Conclusions

In this paper, the FCGR of welded Al 6013-T4 has been probabilistically assessed by the MCM. The MCM was able to predict the confidence interval with the upper and lower probabilistic lines at 90 % and 1 %, respectively. By using these probabilities, the FCGR lines could be probabilistically assessed using only a particular limit of FCG data. It was found that MCM was suitable to be applied as a prediction tool for FCGR since it can perform a rational prediction at 90 %. This rational prediction was defined as the fastest FCGR. On the other hand, the 1 % probability was the non-rational prediction where the lowest FCGR occurred.
