Abstract

Riccati differential equations have played important roles in the theory and practice of control systems engineering. Our goal in this paper is to propose a new multistage successive approximation method for solving Riccati differential equations. The multistage successive approximation method is derived from an existing piecewise variational iteration method for solving Riccati differential equations. The multistage successive approximation in comparison with the existing piecewise variational iteration at iteration method. Computing implementation in comparison with the existing piecewise variational iteration method. Computational tests show that the order of accuracy of the multistage successive approximation method can be made higher by simply taking more number of successive iterations in the multistage evolution. Furthermore, taking small size of each subinterval and taking large number of iterations in the multistage evolution lead that our proposed method produces small error and becomes high order accurate. © 2021, Institute of Advanced Engineering and Science. A Adam 5 months ago

Hi

in Scopus (https://www.scopus.com/sourceid/21100826382), it shows the coverage is until 2021. But here says till 2019! I think it should be updated here.

reply

Melanie Ortiz 5 months ago

SCImago Team

Dear Adam,

Thank you very much for your comment.

All the metadata have been provided by Scopus /Elsevier in their last update sent to SCImago, including the Coverage's period data. The SJR for 2019 was released on 11 June 2020. We suggest you consult the Scopus database directly to see the current index status as SJR is a static image (the update is made one time per year) of Scopus, which is changing every day.

For further information, please contact Scopus support:

https://service.elsevier.com/app/answers/detail/a_id/14883/kw/scimago/supporthub/scopus/ Best Regards, SCImago Team

Hi, I submit my paper in this journal before 8 months until now nothing, just in review

reply

Melanie Ortiz 8 months ago

SCImago Team

Dear Ali,

thank you for contacting us. We are sorry to tell you that SCImago Journal & Country Rank is not a journal. SJR is a portal with scientometric indicators of journals indexed in Elsevier/Scopus. Unfortunately, we cannot help you with your request, we suggest you contact the journal's editorial staff, so they could inform you more deeply. Best Regards, SCImago Team

F Fareha Nizam 10 months ago

On Scoups website, if is showing that this journal is still indexed... Can you please clear the doubt. https://www.scopus.com/sourceid/21100826382

reply

Melanie Ortiz 10 months ago

Dear Fareha, thank you very much for your comment. We suggest you consult the Scopus database directly. Keep in mind that the SJR is a static image (the update is made one time per year) of a database (Scopus) which is changing every day.

Best Regards, SCImago Team

Mabrok 11 months ago

The rank of this journal was Q2 last month, but now i can see it as Q3. My question, when will be the next update of ranking for this journal by SJR? Thanks

reply

Melanie Ortiz 11 months ago

Dear Mabork.

Thank you for contacting us. Our data come from Scopus, they annually send us an update of the data. This latest SJR's update was published on June 11th, 2020. Thus, the indicators for 2020 will be available in June 2021. Best Regards, SCImago Team

Saurabh Bajpai 12 months ago

01102742 Bulletin of EEI Stats

This journal operates a conventional single-blind reviewing policy in which the reviewer's name is always concealed from the submitting author. Authors should present their papers honestly without fabrication, falsification, plagiarism or inappropriate data manipulation. Submitted papers are evaluated by anonymous referees for contribution, originality, relevance, and presentation. Papers will be sent for anonymous review by at least two reviewers who will either be members of the Editorial Board or others of similar standing in the field. In order to shorten the review process and respond quickly to authors, the Editors may triage a submission and come to a decision without sending the paper for external review. The Editor shall inform you of the results of the review as soon as possible, hopefully in 8-12 weeks. The Editors' decision is final and no correspondence can be entered into concerning manuscripts considered unsuitable for publication in this ournal. All correspondence, including notification of the Editors' decision and requests for revisions, will be sent by email

Open Access Policy

This journal adhere to the best practice and high publishing standards and comply with the following conditions:

- 1. Provides immediate open access to its content on the principle that making research freely available to the public supports a
- greater global exchange of knowledge; 2. Allows the author to hold the copyright and to retain publishing right without restrictions;
- Deposits content with a long term digital preservation or archiving program; 3.
- 4. Uses DOIs as permanent identifiers;
- Embeds machine-readable CC licensing information in articles;
- Allows generous reuse and mixing of content, in accordance with CC BY-NC license;
 Can Provide Provide article level metadata for any indexers and aggregators
 Has a deposit policy registered with a deposit policy registry, e.g. Sherpa/Romeo.

If you would like to make a donation and help us to support the cost of wide open access dissemination of research results, to manage the various costs associated with handling and editing of the submitted manuscripts, and the Journal management and publication in general, kindly please contact: info@journal.uad.ac.id

Archiving

This journal utilizes the LOCKSS system to create a distributed archiving system among participating libraries and permits those libraries to create permanent archives of the journal for purposes of preservation and restoration. More.

Publication Ethics and Publication Malpractice Statement

This statement clarifies ethical behaviour of all parties involved in the act of publishing an article in our journals, including the authors, the editors, the peer-reviewers and the publisher (Universitas Ahmad Dahlan and Institute of Advanced Engineering and Science). This statement is based on COPE's Best Practice Guidelines for Journal Editors

Ethical Guideline for Journal Publication

The publication of an article in a peer-reviewed IAES Journals is an essential building block in the development of a coherent and respected network of knowledge. It is a direct reflection of the quality of the work of the authors and the institutions that support them. Peer-reviewed articles support and embody the scientific method. It is therefore important to agree upon standards of expected ethical behavior for all parties involved in the act of publishing: the authors, the journal editors, the peer reviewers, the publisher and the society

Universitas Ahmad Dahlan (UAD) and Institute of Advanced Engineering and Science (IAES) as publisher of this Journal takes its duties of guardianship over all stages of publishing extremely seriously and we recognize our ethical and other responsibilities. We are committed to ensuring that advertising, reprint or other commercial revenue has no impact or influence on editorial decisions. In addition, the UAD, IAES and Editorial Board will assist in communications with other journals and/or publishers where this is useful and necessary

Publication decisions

The editors of the IAES journals are responsible for deciding which of the articles submitted to the journal should be published. The validation of the work in question and its importance to researchers and readers must always drive such decisions. The editors may be guided by the policies of the journal's editorial board and constrained by such legal requirements as shall then be in force regarding libel, copyright infringement and plagiarism. The editors may confer with other editors or reviewers in making this decision.

Fair play

An editor at any time evaluate manuscripts for their intellectual content without regard to race, gender, sexual orientation, religious belief, ethnic origin, citizenship, or political philosophy of the authors

Confidentiality

The editor and any editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding author, reviewers, potential reviewers, other editorial advisers, and the publisher, as appropriate

Disclosure and conflicts of interest

Unpublished materials disclosed in a submitted manuscript must not be used in an editor's own research without the express written consent of the author

Duties of Reviewers

Contribution to Editorial Decisions

Peer review assists the editor in making editorial decisions and through the editorial communications with the author may also assist the author in improving the paper

Promptness

Any selected referee who feels unqualified to review the research reported in a manuscript or knows that its prompt review will be impossible should notify the editor and excuse himself from the review process.

Confidentiality

Any manuscripts received for review must be treated as confidential documents. They must not be shown to or discussed with others except as authorized by the editor.

Standards of Objectivity

Reviews should be conducted objectively. Personal criticism of the author is inappropriate. Referees should express their views clearly with supporting arguments.

Acknowledgement of Sources

Reviewers should identify relevant published work that has not been cited by the authors. Any statement that an observation, derivation, or argument had been previously reported should be accompanied by the relevant citation. A reviewer should also call to the editor's attention any substantial similarity or overlap between the manuscript under consideration and any other published paper of which they have personal knowledge.

Disclosure and Conflict of Interest

Privileged information or ideas obtained through peer review must be kept confidential and not used for personal advantage. Reviewers should not consider manuscripts in which they have conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions connected to the papers.

Duties of Authors

Reporting standards

Authors of reports of original research should present an accurate account of the work performed as well as an objective discussion of its significance. Underlying data should be represented accurately in the paper. A paper should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behaviour and are unacceptable.

Data Access and Retention

Authors are asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide public access to such data (consistent with the ALPSP-STM Statement on Data and Databases), if practicable, and should in any event be prepared to retain such data for a reasonable time after publication.

Originality and Plagiarism

The authors should ensure that they have written entirely original works, and if the authors have used the work and/or words of others that this has been appropriately cited or quoted.

Multiple, Redundant or Concurrent Publication

An author should not in general publish manuscripts describing essentially the same research in more than one journal or primary publication. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behaviour and is unacceptable.

Acknowledgement of Sources

Proper acknowledgment of the work of others must always be given. Authors should cite publications that have been influential in determining the nature of the reported work.

Authorship of the Paper

Authorship should be limited to those who have made a significant contribution to the conception, design, execution, or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included on the paper, and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

Hazards and Human or Animal Subjects

If the work involves chemicals, procedures or equipment that have any unusual hazards inherent in their use, the author must clearly identify these in the manuscript.

Disclosure and Conflicts of Interest

All authors should disclose in their manuscript any financial or other substantive conflict of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.

Fundamental errors in published works

When an author discovers a significant error or inaccuracy in his/her own published work, it is the author's obligation to promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.

Withdrawal of Manuscripts

Author is not allowed to withdraw submitted manuscripts, because the withdrawal is waste of valuable resources that editors and referees spent a great deal of time processing submitted manuscript, money and works invested by the publisher. If author still requests withdrawal of his/her manuscript when the manuscript is still in the peer-reviewing process, author will be

punished with paying \$200 per manuscript, as withdrawal penalty to the publisher. However, it is unethical to withdraw a submitted manuscript from one journal if accepted by another journal. The withdrawal of manuscript after the manuscript is accepted for publication, author will be punished by paying US\$500 per manuscript. Withdrawal of manuscript is only allowed after withdrawal penalty has been fully paid to the Publisher.

Checklist for preparing your paper for publication

- 1. Is your manuscript written in IAES format? At this stage, it is essential that you follow every detail of IAES format. Please try to follow the format as closely as possible.
- is your title adequate and is your abstract correctly written? The title of paper is max 10 words, without Acronym or abbreviation. The Abstract (MAX 200 WORDS) should be informative and completely self-explanatory (no citation in abstract), provide a clear statement of the problem, the proposed approach or solution, and point out major findings and conclusions
- 3. Authors are suggested to present their articles in the sections structure: Introduction The Proposed Method/Algorithm/Procedure specifically designed (optional) - Research Method - Results and Discussion – Conclusion. Authors may present complex proofs of theorems or non-obvious proofs of correctness of algorithms after introduction section (obvious theorems & straightforward proofs of existing theorems are NOT needed).
- 4. Introduction section: explain the context of the study and state the precise objective. An Introduction should contain the following three parts:
- Background: Authors have to make clear what the context is. Ideally, authors should give an idea of the state-of-the art of the field the report is about. - The Problem: If there was no problem, there would be no reason for writing a manuscript, and definitely no reason for

reading it. So, please tell readers why they should proceed reading. Experience shows that for this part a few lines are often sufficient

- The Proposed Solution: Now and only now! - authors may outline the contribution of the manuscript. Here authors have to make sure readers point out what are the novel aspects of authors work

- Authors should place the paper in proper context by citing relevant papers. At least, 5 references (recently journal articles) are used in this section. 5. Method section: the presentation of the experimental methods should be clear and complete in every detail facilitating
- reproducibility by other scientists. 6. Results and discussion section: The presentation of results should be simple and straightforward in style. This section
- reports the most important findings, including results of statistical analyses as appropriate and comparisons to other research results. Results given in figures should not be repeated in tables. This is where the author(s) should explain in words what he/she/they discovered in the research. It should be clearly laid out and in a logical sequence. This section should be supported with suitable references.
- Conclusion section: Summarize sentences the primary outcomes of the study in a paragraph. Are the claims in this section supported by the results, do they seem reasonable? Have the authors indicated how the results relate to expectations and to earlier research? Does the article support or contradict previous theories? Does the conclusion explain how the research has moved the body of scientific knowledge forward?
- 8. Language. If an article is poorly written due to grammatical errors, while it may make it more difficult to understand the
- 9. Please be sure that the manuscript is up to date. It is expected that 10 to 20% of references are to recent papers.
- 10. Is the manuscript clearly written? Is the article exciting? Does the content flow well from one section to another? Please try to keep your manuscript on the proper level. It should be easy to understand by well qualified professionals, but at the same time please avoid describing well known facts (use proper references instead). Often manuscripts receive negative reviews because reviewers are not able to understand the manuscript and this is authors' (not reviewers') fault. Notice, that if
- reviewers have difficulties, then other readers will face the same problem and there is no reason to publish the manuscript. 11. Do you have enough references? We will usually expect a minimum of 20 to 25 references primarily to journal papers, depending on the length of the paper. Citations of textbooks should be used very rarely and citations to web pages should be avoided. All cited papers should be referenced within the text of the manuscript.
- 12. Figures and Tables. Relation of Tables or Figures and Text: Because tables and figures supplement the text, all tables and figures should be referenced in the text. Authors also must explain what the reader should look for when using the table or figure. Focus only on the important point the reader should draw from them, and leave the details for the reader to examine on her own.

Figures:

- a. All figures appearing in article must be numbered in the order that they appear in the text.
- b. Each figure must have a caption fully explaining the content
- c. Figure captions are presented as a paragraph starting with the figure number i.e. Figure 1, Figure 2, etc. d. Figure captions appear below the figure
- e. Each figure must be fully cited if taken from another article f. all figures must be referred to in the body of the article
- Tables:
- a. Material that is tabular in nature must appear in a numbered captioned table.
- b. All tables appearing in article must be numbered in the order that they appear in the text. c. Each table must have a caption fully explaining the content with the table number i.e. Table 1, Table 2, etc.
- d. Each column must have a clear and concise heading
- e. Tables are to be presented with single horizontal line under: the table caption, the column headings and at the end of the table
- f. All tables must be referred to in the body of the article

- g. Each table must be fully cited if taken from another article 13. Each citation should be written in the order of appearance in the text in square brackets. For example, the first citation [1], the second citation [2], and the third and fourth citations [3,4]. When citing multiple sources at once, the preferred method to list each number separately, in its own brackets, using a comma or dash between numbers, as such: [1], [3], [5] or [4-8]. It is not necessary to mention an author's name, pages used, or date of publication in the in-text citation. Instead, refer to the source with a number in a square bracket, e.g. [9], that will then correspond to the full citation in your reference list. Examples of in-text citations:
 - This theory was first put forward in 1970 [9]."
 - Sutikno [10] has argued that.
 - Several recent studies [7], [9], [11-15] have suggested that...
 - ...end of the line for my research [16]

14. Please be aware that for the final submission of regular paper you will be asked to tailor your paper so the last page is not half empty

Policy of Plagiarism Detection

The peer-review process is at the heart of scientific publishing. As part of IAES's commitment to protecting the integrity of the scholarly record, IAES feels a strong obligation to support the scientific community in all aspects of research and publishing ethics All submitted manuscripts must be free from plagiarism contents. All authors are suggested to use plagiarism detection software to do the similarity checking before submitting their manuscript to the journal (please use iThenticate or Turnitin to check the similarity). Editors will also check the similarity of manuscripts in this journal by using a Turnitin or iThenticate software. The manuscript will instantly be rejected if there is a plagiarism indicated or detected

Final camera ready also will be checked again for similarity rate. The overall similarity rate of a manuscript should not exceed 25%, and the similarity rate to a single source should not exceed 10%. Plagiarism check with Turnitin or iThenticate software. Using another plagiarism software apart from Turnitin or iThenticate software can not be accepted.

Keywords:

Multistage method Piecewise method Riccati differential equations Successive approximation Variational iteration method

ABSTRACT

Riccati differential equations have played important roles in the theory and practice of control systems engineering. Our goal in this paper is to propose a new multistage successive approximation method for solving Riccati differential equations. The multistage successive approximation method is derived from an existing piecewise variational iteration method for solving Riccati differential equations. The multistage successive approximation method is simpler in terms of computing implementation in comparison with the existing piecewise variational iteration method. Computational tests show that the order of accuracy of the multistage successive approximation method can be made higher by simply taking more number of successive iterations in the multistage evolution. Furthermore, taking small size of each subinterval and taking large number of iterations in the multistage evolution lead that our proposed method produces small error and becomes high order accurate.

1. INTRODUCTION

Mathematical modelling and simulation have been applied extensively in the areas of telecommunication [1], [2], computing [3]-[5], electronics [6], [7] and control [8], [9]. One of important models in these areas is the Riccati differential equation. Riccati differential equations occur in control systems engineering. Control systems engineering itself has played important roles in electrical engineering and related areas [10]. Riccati differential equations are quadratic with respect to the unknown function. These equations are named after a Venetian mathematician, Jacopo Francesco Riccati (1676–1754) [11]. The term Riccati equation is also used to refer to an analogous matrix equation occuring in quadratic control problems. The non-dynamic steady-state version of them is referred to as the algebraic Riccati equation.

Riccati equations and their properties are applied in recent publications [12]-[15]. A number of studies relating to Riccati equations are also reported in the literature [16]-[21]. Due to the importance of Riccati equations, we focus on proposing a computing method for solving Riccati differential equations.

Amongst available methods in the literature, successive approximation and variational iteration methods are able to provide accurate solutions near the initial point of the domain. Successive approximation methods are successful in solving various problems [22]-[23]. Variational iteration methods are also powerful in solving a wide variety of mathematical models [24]-[27]. Interestingly, these two methods (successive

approximation and variational iteration methods) are identical for a particular setting, as reported by Jafari [28].

Our contribution (our goal) in this paper is to propose a new multistage successive approximation method for solving Riccati differential equations. We recall an existing piecewise variational iteration method due to Geng, *et al.* [29]. We modify the method of Geng, *et al.* [29] to obtain the multistage successive approximation method. The modification leads to a simpler implementation of the resulting method in terms of computation. Riccati differential equations have the following form

$$\frac{dy}{dx} = p(x) + q(x)y(x) + r(x)y^{2}(x)$$
(1)

on $0 < x \leq X$, with initial condition

$$y(0) = y_0 \tag{2}$$

where x is the free variable, y(x) is the unknown function dependent on x, X is a known positive constant, and y_0 is a given constant. We note that if p(x) = 0, (1) becomes a Bernoulli equation. If r(x) = 0, (1) reduces to a first order linear ordinary differential equation. The Riccati differential equation with the case of p(x) = 0 or r(x) = 0 can be solved using standard methods for ordinary differential equations. In this paper, we consider that $p(x) \neq 0$ and $r(x) \neq 0$. Due to the important roles of Riccati differential equations in control systems engineering, a simple but accurate solver is desired. Providing a simple and accurate method for solving Riccati differential equations is the aim of this paper.

This paper is organised as follows. We explain the problem that we want to tackle in section 2. We propose a multistage successive approximation method for solving Riccati differential equations in section 3. Results and discussion are provided in section 4. The paper is concluded in section 5.

2. PROBLEM DESCRIPTION

In this section, we recall an existing piecewise variational iteration method for solving Riccati differential equations due to Geng, *et al.* [29]. The variational iteration method itself, for the general case, was originally proposed by He [30]-[32].

Considering Riccati differential (1) with initial condition (2) on domain $0 \le x \le X$, Geng, *et al.* [29] took the correction functional

$$y_{n+1}(x) = y_n(x) + \int_0^x \lambda(\xi) \left[\frac{dy_n(\xi)}{d\xi} - q(\xi)\bar{y}_n(\xi) - r(\xi)\bar{y}_n^2(\xi) - p(\xi) \right] d\xi,$$
(3)

where \bar{y}_n is a restricted variation, that is, $\delta \bar{y}_n = 0$; $\lambda(\xi)$ is a Lagrange multiplier, which should be determined optimally. Taking the variation of (3), we obtain

$$\delta y_{n+1}(x) = \delta y_n(x) + \delta \int_0^x \lambda(\xi) \left[\frac{dy_n(\xi)}{d\xi} - q(\xi) \bar{y}_n(\xi) - r(\xi) \bar{y}_n^2(\xi) - p(\xi) \right] d\xi, \tag{4}$$

Simplifying (4), we obtain

$$\delta y_{n+1}(x) = \delta y_n(x) + \delta \int_0^x \lambda(\xi) \left[\frac{dy_n(\xi)}{d\xi} \right] d\xi,$$
(5)

Integrating (5) by parts, we have

$$\delta y_{n+1}(x) = \delta \left[\left(1 + \lambda(x) \right) y_n(x) \right] + \delta \int_0^x y_n(\xi) \lambda'(\xi) d\xi, \tag{6}$$

Considering (6), we come to the following stationary conditions

$$1 + \lambda(x) = 0, \lambda'(\xi) = 0. \tag{7}$$

Solving stationary conditions (7), we obtain that the optimal Lagrange multiplier is

$$\lambda(\xi) = -1. \tag{8}$$

Therefore, with Lagrange multiplier (8), the variational iteration method due to Geng, et al. [29] is

$$y_{n+1}(x) = y_n(x) - \int_0^x \left[\frac{dy_n(\xi)}{d\xi} - q(\xi)y_n(\xi) - r(\xi)y_n^2(\xi) - p(\xi) \right] d\xi,$$
(9)

which is for solving Riccati differential (1) with initial condition (2) on domain $0 \le x \le X$.

Realising that the variational iteration method (9) produces analytical approximate solutions which are accurate only for points close enough to the initial position, Geng, et al. [29] implemented the method (9) piecewisely. By piecewisely, Geng, et al. [29] meant that the original interval I = [0, X] was subdivided into a finite number of subintervals $I_j = [x_{j-1}, x_j]$, where j = 1, 2, 3, ..., J for a positive integer J. The width of each subinterval is assumed to be the same, that is, $\Delta x = x_j - x_{j-1}$ for all j. With this setting, we have J + 1discrete points of the original interval I = [0, X], that is, $x_0 = 0$, $x_1 = \Delta x$, $x_2 = 2\Delta x$, ..., $x_j = J\Delta x = X$. We denote $y_{j,n}(x)$ the analytical approximate solution on the jth subinterval at the nth variational iteration. Suppose that the maximum number of variational iterations is N, where N is a specified positive integer. This means that n = 0, 1, 2, ..., N.

The piecewise variational iteration method due to Geng, *et al.* [29] works as follows. As the first step, on subinterval $I_1 = [x_0, x_1]$, we take the initialization

$$y_{1,0}(x) = y(x_0) = y(0) = y_0$$
(10)

and iterations

$$y_{1,n+1}(x) = y_{1,n}(x) - \int_{x_0}^x \left[\frac{dy_{1,n}(\xi)}{d\xi} - q(\xi)y_{1,n}(\xi) - r(\xi)y_{1,n}^2(\xi) - p(\xi) \right] d\xi,$$
(11)

for n = 0, 1, 2, ..., N - 1. As shown in (10) and (11), as the second step, on subinterval $I_2 = [x_1, x_2]$, we take the initialization

$$y_{2,0}(x) = y_{1,N}(x_1) \tag{12}$$

and iterations

$$y_{2,n+1}(x) = y_{2,n}(x) - \int_{x_1}^x \left[\frac{dy_{2,n}(\xi)}{d\xi} - q(\xi)y_{2,n}(\xi) - r(\xi)y_{2,n}^2(\xi) - p(\xi) \right] d\xi,$$
(13)

for n = 0, 1, 2, ..., N - 1. As shown in (12) and (13), as the next steps, on subintervals $I_j = [x_{j-1}, x_j]$, where j = 3, 4, 5, ..., J, we take the initialization

$$y_{j,0}(x) = y_{j-1,N}(x_{j-1})$$
(14)

and iterations

$$y_{j,n+1}(x) = y_{j,n}(x) - \int_{x_{j-1}}^{x} \left[\frac{dy_{j,n}(\xi)}{d\xi} - q(\xi)y_{j,n}(\xi) - r(\xi)y_{j,n}^{2}(\xi) - p(\xi) \right] d\xi,$$
(15)

for n = 0, 1, 2, ..., N - 1. Using (10)-(15), we obtain the solution on the whole domain.

Now, the most expensive computation with the formulation of Geng, *et al.* [29] above lies on the part where we need to calculate the derivative $dy_{j,n}(\xi)/d\xi$ and integrate the results from x_{j-1} to $x \in I_j$. These tasks are redundant. To obtain a simpler method for solving Riccati differential equations, we need to modify this piecewise variational iteration method of Geng, *et al.* [29]. This is the problem that we aim to solve in this paper.

3. PROPOSED MULTISTAGE SUCCESSIVE APPROXIMATION METHOD

In this section, we propose a modification of the piecewise variational iteration method of Geng, *et al.* [29], so that the modified method is simpler in terms of computing implementation, yet its accuracy does not change. We reconsider the iterative formula of the variational iteration method (9) and do the integration for the term having the derivative of the unknown function, so as shown in (9) becomes

$$y_{n+1}(x) = y_0 + \int_0^x [q(\xi)y_n(\xi) + r(\xi)y_n^2(\xi) + p(\xi)]d\xi,$$
(16)

where for n = 0, 1, 2, ..., N - 1. Iterative formula (16) is Picard's successive approximation method for Riccati differential (1). The iterative in (16) of the successive approximation method is equivalent to the iterative formula of the variational iteration method (9), but in (16) is simpler.

Now, we shall implement the iterative (16) of the successive approximation method (SAM) piecewisely. The resulting method is called multistage successive approximation method (MSAM) for solving Riccati differential equations. Our MSAM works as follows. As the first step, on subinterval $I_1 = [x_0; x_1]$, we take the initialization

$$y_{1,0}(x) = y(x_0) = y(0) = y_0$$
(17)

and iterations

$$y_{1,n+1}(x) = y_0 + \int_{x_0}^x \left[q(\xi) y_{1,n}(\xi) + r(\xi) y_{1,n}^2(\xi) + p(\xi) \right] d\xi,$$
(18)

for n = 0, 1, 2, ..., N - 1. As shown in (17) and (18), as the second step, on subinterval $I_2 = [x_1, x_2]$, we take the initialization

$$y_{2,0}(x) = y_{1,N}(x_1) \tag{19}$$

and iterations

$$y_{2,n+1}(x) = y_{2,0}(x) + \int_{x_1}^x \left[q(\xi) y_{2,n}(\xi) + r(\xi) y_{2,n}^2(\xi) + p(\xi) \right] d\xi,$$
(20)

for n = 0, 1, 2, ..., N - 1. As shown in (19) and (20), as the second step, on subinterval $I_j = [x_{j-1}, x_j]$, we take the initialization

$$y_{j,0}(x) = y_{j-1,N}(x_{j-1})$$
(21)

and iterations

$$y_{j,n+1}(x) = y_{j,0}(x) + \int_{x_{j-1}}^{x} \left[q(\xi) y_{j,n}(\xi) + r(\xi) y_{j,n}^2(\xi) + p(\xi) \right] d\xi,$$
(22)

for n = 0, 1, 2, ..., N - 1. Using (17)-(22), we obtain the solution on the whole domain.

To optimise our MSAM further, in the computer implementation, we compute the successive approximation formula symbolically only once:

$$y_{j,n+1}(x) = y_{j-1,N}(x_{j-1}) + \int_{x_{j-1}}^{x} \left[q(\xi) y_{j,n}(\xi) + r(\xi) y_{j,n}^2(\xi) + p(\xi) \right] d\xi,$$
(23)

for n = 0, 1, 2, ..., N - 1. Then, the obtained symbolic formula from (23) is used to solve the Riccati differential equation on each subinterval I_i consecutively for j = 1, 2, 3, ..., J. Here, we speficy that

$$y_{0,n}(x_0) = y_0 \tag{24}$$

for all n. In (24) means that the given initial value is used as the starting point of solution.

4. **RESULTS AND DISCUSSION**

In this section, we provide research results on the performance tests of our proposed method and discuss about them. We take two computational tests, namely, a Riccati differential equation with constant coefficients and a Riccati differential equation involving a variable coefficient. Error on the considered domain is defined as the average of relative errors at all discrete points on the domain.

4.1. Riccati differential equation with constant coefficients

As the first test, we consider the Riccati differential equation with constant coefficients [29]:

$$\frac{dy(x)}{dx} = 1 + 2y(x) - y^2(x), 0 < x \le 4,$$
(25)

having initial condition

$$y(0) = 0 \tag{26}$$

The exact solution to this problem is

$$y(x) = 1 + \sqrt{2} \tanh\left(\sqrt{2}x + \frac{1}{2}\log\left(\frac{-1+\sqrt{2}}{1+\sqrt{2}}\right)\right).$$
(27)

Our computational experiments show that the standard SAM is not able to solve the problem on the whole domain. In contrast, our proposed MSAM is able to solve the problem on the whole domain accurately. These phenomena are shown in Figure 1(a), where SAM and MSAM use 3 successive iterations, and in addition, for MSAM we use $\Delta x = 0.1$.

To investigate further about the performance of MSAM, we record the errors and their orders of convergence in Tables 1-4. We obtain that the number of successive iterations in the MSAM evolution determines the order of convergence of the solution. One successive iteration in the MSAM evolution leads that MSAM is a first order method. This is observed as Δx approaches to zero, the order of convergence tends to one, as recorded in Table 1. Two successive iterations in the MSAM evolution leads that MSAM is a second order method, because as Δx approaches to zero, the order of convergence tends to two, as recorded in Table 2. Three successive iterations in the MSAM evolution leads that MSAM is a third order method, because as Δx approaches to zero, the order of convergence tends to three, as recorded in Table 3. Similarly, four successive iterations in the MSAM evolution leads that MSAM is a fourth order method, because as Δx approaches to zero, the order of convergence tends to four, as recorded in Table 4. In general, smaller Δx results in smaller error. Furthermore, more successive iterations results in higher order accurate method.

0.015625	1.407E-09	3.97

A multistage successive approximation method for Riccati differential equations (Petrus Setyo Prabowo)

4.2. Riccati differential equation involving a variable coefficient

As the second test, let us consider the Riccati differential equation with a variable coefficient [29]:

$$\frac{dy(x)}{dx} = 1 + x^2 - y^2(x), 0 < x \le 4,$$
(28)

with initial condition

$$y(0) = 1 \tag{29}$$

The exact solution to this problem is

$$y(x) = x + \frac{e^{-x^2}}{1 + \int_0^x e^{-\xi^2 d\xi}}$$
(30)

For this second test, the standard SAM is not able to solve the problem, even for the first half [0,2] of the given domain [0,4], as shown in Figure 1(b). In contrast, our proposed MSAM is able to solve the problem on the whole domain [0,4] accurately. For this Figure 1(b), SAM and MSAM use 3 successive iterations, and in addition, for MSAM we take $\Delta x = 0.1$.

To investigate further about the performance of MSAM in solving this second test case, we record the errors and their orders of convergence in Tables 5-8. The behaviour of MSAM in this test case is consistent with that of MSAM in the previous test case. We obtain that the number of successive iterations in the MSAM evolution determines the order of convergence of the solution. One successive iteration in the MSAM evolution leads that MSAM is a first order method. This is observed as Δx approaches to zero, the order of convergence tends to one, as recorded in Table 5. Two successive iterations in the MSAM evolution leads that MSAM is a second order method. This is observed as Δx approaches to zero, the order of convergence tends to two, as recorded in Table 6. Three successive iterations in the MSAM evolution leads that MSAM is a third order method. This is observed as Δx approaches to zero, the order of convergence tends to two, as recorded in Table 6. Three successive iterations in the MSAM evolution leads that MSAM is a third order method. This is observed as Δx approaches to zero, the order of convergence tends to two, as recorded in Table 7. Similarly, four successive iterations in the MSAM evolution leads that MSAM is a fourth order method, because as Δx approaches to zero, the order of convergence tends to three, as recorded in Table 7. Similarly, four successive iterations in the MSAM evolution leads that MSAM is a fourth order method, because as Δx approaches to zero, the order of convergence tends to four, as recorded in Table 8. Again, in general, smaller Δx results in a more accurate method. Furthermore, more number of successive iterations makes MSAM to be higher order accurate.

With our accurate results in this paper, we are confident that MSAM is a reliable method to be used for other kinds of initial value problems. The idea of MSAM could be adapted for continuous versions of discrete problems in computing [33], and it could be extended to be analysed using advanced mathematical tools, such as, algebraic geometry and conformal mapping.

5. CONCLUSION

We have proposed successfully a new multistage successive approximation method for solving Riccati differential equations. The main advantage of the proposed method is that it is simpler than the existing variational iteration method for solving Riccati differential equations. The proposed method is analytically equivalent to the existing method, but simpler in terms of computing implementation. We have tested the performance of the multistage successive approximation method in cases that their exact solutions are known. The order of accuracy of the proposed method can be made higher by simply taking more number of successive iterations in the multistage evolution. Obviously, taking smaller size of each subinterval and taking more number of iterations in the multistage evolution lead that our proposed method produces smaller error and it becomes higher order accurate. With these results, in cases that the exact solutions to Riccati differential equations are not known, we are confident to propose the use of the multistage successive approximation method for solving them to obtain accurate approximate solutions.

BIOGRAPHIES OF AUTHORS

Petrus Setyo Prabowo is an assistant professor at the Department of Electrical Engineering, Faculty of Science and Technology, Sanata Dharma University, Yogyakarta, Indonesia. He obtained the bachelor's degree Sarjana Teknik in Electrical Engineering from Gadjah Mada University, Yogyakarta, Indonesia in 1997. He received the master's degree Magister Teknik in Electrical Engineering from the National Institute of Science and Technology (Institut Sains dan Teknologi Nasional), Jakarta, Indonesia in 2010. He has been an Intermediate Professional Engineer (Insinyur Profesional Madya) according to the Institution of Engineers Indonesia (Persatuan Insinyur Indonesia) since 2016. His research interests include control and optimization in electric power systems. He was the Head of the Department of Electrical Engineering, Faculty of Science and Technology, Sanata Dharma University in 2012-2020.

Sudi Mungkasi has been with the Department of Mathematics, Faculty of Science and Technology, Sanata Dharma University, Yogyakarta, Indonesia since 2005. He is currently an associate professor at the Department of Mathematics and the Dean of the Faculty of Science and Technology at Sanata Dharma University. He received the bachelor's degree in mathematics from Gadjah Mada University, Yogyakarta, Indonesia in 2004. Both master's and PhD degrees in mathematical sciences were obtained from The Australian National University, Canberra, Australia in 2008 and 2013, respectively. He was a postdoctoral fellow at the Mathematical Sciences Institute, The Australian National University in 2013. His research interests include applied and computational mathematics for physical, biological, chemical, and engineering problems, such as, electrical engineering problems.
