SCOPE

E3S Web of Conferences is an Open Access publication series dedicated to archiving conference proceedings in all areas related to Environment, Energy and Earth [Sciences](#). The journal covers the technological and [scientific](#) aspects as well as social and economic matters. Major disciplines include: soil sciences, hydrology, oceanography, climatology, geology, geography, energy engineering (production, distribution and storage), renewable energy, sustainable development, natural resources management... E3S Web of Conferences offers a wide range of services from the organization of the submission of conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference proceedings. E3S Web of Conferences offers a wide range of services from the organization of the submission of conference proceedings to the worldwide dissemination of the conference papers. It provides an efficient archiving solution, ensuring maximum exposure and wide indexing of scientific conference proceedings. Proceedings are published under the scientific responsibility of the conference editors.

Effect of curing temperature on the mechanical properties of coconut shell nano carbon reinforced composites with epoxy matrix 01001

Petrus Iwan and I. Gusti Ketut Puja

Published online: 08 January 2024

DOI: <https://doi.org/10.1051/e3sconf/202447501001>

Abstract | PDF (2.541 MB) | References | NASA ADS Abstract Service

☐ Open Access

The role of nanocatalyst of pearl oyster shell in pack carburizing process on mechanical and physical properties of AISI 1020 steel 01002

Muhammad Rafi, I. Gusti Ketut Puja and Rines Rines

Published online: 08 January 2024

DOI: <https://doi.org/10.1051/e3sconf/202447501002>

Abstract | PDF (2.299 MB) | References | NASA ADS Abstract Service

☐ Open Access

Transparent carbon capture and storage using blockchain technology 01003

Gabriela Aristia and Khondaker Salehin

Published online: 08 January 2024

DOI: <https://doi.org/10.1051/e3sconf/202447501003>

Abstract | PDF (2.853 MB) | References | NASA ADS Abstract Service

☐ Open Access

Investigation of Eichhornia crassipes as a natural fibre in PMC for noise controller 01004

Paulina Dwi Nawanti, Dionisius Brian Deva Erwandha, Budi Setyahandana and I.M.W. Ekaputra

Published online: 08 January 2024

DOI: <https://doi.org/10.1051/e3sconf/202447501004>

Abstract | PDF (2.367 MB) | References | NASA ADS Abstract Service

☐ Open Access

Exploring the potential of GO-based composite hydrogels and their swelling property for controlled drug delivery 01005

Aning Ayucitra and Yi-Hsu Ju

Published online: 08 January 2024

DOI: <https://doi.org/10.1051/e3sconf/202447501005>

[Abstract](#) | [PDF \(2.583 MB\)](#) | [References](#) | [NASA ADS Abstract Service](#)

PREFACE

The 1st International Conference on Applied Sciences and Smart Technologies (InCASST 2023) has been organized by the Faculty of Science and Technology, Sanata Dharma University, Yogyakarta, Indonesia. This event was held on October 18–19, 2023, in Yogyakarta, Indonesia. As an effort to contribute in distributing research outcomes, especially in the search for renewable and clean energy, waste management, environmental management, and sustainable agriculture. InCASST 2023 presented four honorable international keynote speakers from representative countries: 1) Prof. Tokuro Matsuo, Advanced Institute of Industrial Technology - Japan; 2) Prof. Ir. Sudi Mungkasi, Ph.D., Sanata Dharma University-Indonesia; 3) Assoc. Prof. Dr. Peerapong Uthansakul, Suranaree University of Technology – Thailand, and 4) Assist. Prof. Dr. Eng. Rando Tungga Dewa, The Republic of Indonesia Defense University-Indonesia. This event selected local researchers and overseas fellows to share their best research works at this conference to reach a broader network of researchers. After a rigorous selection process, the Scientific & Editorial Board decided to publish 46 papers in E3S Web of Conferences, open-access proceedings in environment, energy, and earth sciences, managed by EDP Sciences, and indexed on Scopus, Scimago.

The published papers have passed all necessary improvement requirements following the Web of Conferences standard, reviewer's comments, and similarity tests by the Turnitin program. We want to thank the official committee, scientific & editorial boards, and organizing partners. Thanks to our co-host partners, Universitas Katolik Widya Mandala Surabaya, Universitas Prasetya Mulya, and Institut Teknologi Nasional Yogyakarta, for trusting and supporting this conference. Finally, we would like to briefly thank all presenters and attendees for their participation in sharing wonderful ideas and making creative decisions to inspire further research and exchange scientific reasons. We hope this time, all papers can be compiled into scientific works as the first publication of the 2023 InCASST. Lastly, we hope this conference encourages further research collaboration and see you at the next conference.

Assoc. Prof. Dr. Ir. Bernadeta Wuri Harini

Conference chair

Advisory board

- Prof. Dr. Willy Susilo (Wollongong University, Australia)

Call For Paper

Selected papers will be publication to E3S Web of Conferences (Scopus Indexed).

Scopes

- Renewable energy technologies and systems.
- Climate change and global warming.
- Sustainable agriculture and land use practices.
- Environmental impact assessment and management.
- Energy policy and planning.
- Clean energy and green technologies.
- Waste management and recycling.
- Air and water pollution control.
- Environmental biotechnology and microbiology.
- Carbon capture and sequestration.

Important Dates

- Extended New Submission : August 15, 2023
(Full Paper only)
- Accepted Notification : August 22, 2023
- Early Bird payment : April 30, 2023
- Late payment : August 31, 2023
- Full Paper Submission : September 18, 2023
of Accepted Abstract
- Conference Day : October 18, 2023

Registration :

<https://e-conf.usd.ac.id/index.php/incasst/incasst2023>

Registration Fee :

Presenter :

- Offline :
 - Early bird : Rp. 3.250.000 / US\$235
 - Late : Rp. 3.500.000 / US\$250
- Online :
 - Early bird : Rp. 2.950.000 / US\$185
 - Late : Rp. 3.200.000 / US\$200

Non-Presenter :

- Full Board : Rp. 750.000 / US\$60
- Gala Dinner : Rp. 250.000 / US\$25

Payment Method :

- Paypal : suryagovinda@yahoo.com
- Bank Transfer
 - Acc. No : 0373733749
 - Acc. Name : I Gusti Ketut Puja

The effect of chassis weight optimization on the carbon footprint of the electric prototype vehicle

Heryoga Winarbawa^{1*} and *Andreas Prasetyadi*¹

¹Mechanical Engineering Department, Faculty of Science and Technology, Sanata Dharma University, Sleman, Indonesia

Abstract. Electrification of vehicles has become increasingly widespread lately. It aims to reduce carbon emissions globally. Another step, namely reducing vehicle weight, is expected to reduce energy consumption during the operation. A vehicle part that can be reduced in weight is the chassis. This research compares the carbon footprint between the stock chassis and the lightweight version. The lightweight chassis requires additional energy during its fabrication. Life cycle analysis (LCA) is conducted to calculate the carbon footprint of each chassis. Material loss and manufacturing time are the main differences in the footprint. Manufacturing strategy is important in order to minimize the emission of the process. The lightweight chassis can reduce CO₂ emission by 11% assuming 200 hours of operation. Therefore, optimization of the weight significantly reduces the emission.

1 Introduction

Electric vehicles are considered to be a solution for transportation fit into climate action. In dominated coal and hydropower electricity, the electricity vehicles can reduce emissions by 37% and 90%, respectively [1]. Such transportation modes have less carbon emission than internal combustion ones. The electric vehicles have higher direct efficiency than internal combustion vehicles. Electric motor is generally more efficient than diesel and petroleum engines. The electric vehicles reduce fuel transportation. The fuel for electricity just needs transportation from the source to the power plant. A green and clean grid is very positive to lower the emission. The battery capacity and electric intensity are also other factors of emission reducer. Specific travel requirement is important to make emission reduction real [2]. All of the aforementioned factors are external. The fewer moving parts number of the electric vehicles than internal combustion is the factor. However, it also has drawbacks due to battery requirements. The battery tends to be the heaviest part of the vehicle [3].

Lightweight is the key to the electric vehicle. Variation of the vehicle weight depends only on the load of the vehicle during its travel. It is different from an internal combustion vehicle that has fuel as another variable changing during its movement. The energy consumption of the electric vehicle depends on the unladen weight of the vehicle [1]. Heavier vehicle needs more energy for every kilometer travel. Therefore, it is important to make the

* Corresponding author: heryoga@usd.ac.id

electric vehicle as light as possible. Among the parts, chassis is the unladen weight that contributes significantly to the total weight of the vehicle.

Chassis weight optimization is important for better electric vehicles. An excellent chassis provides safety and performance. One of the criteria of a vehicle chassis is its weight. The weight of the chassis can affect significantly the vehicle’s performance due to tractive force requirement. In addition to gradient, and aerodynamic, the rolling force is dominated by its weight [4]. Therefore, it is clear that the weight of the chassis affects the emission operationally.

The emission of a vehicle depends on some factors in LCA. The factors include upstream, operational, and downstream cycles. A study of upstream factors was conducted by Yao, et al. [1]. Analysis of the fuel for all processes was also reported in China [2]. While the study of subsidies to meet the emission of China was the work of Zou et al. [3]. However, a detailed study of chassis effect to emission was not available yet.

The aim of this research is to find out how significantly the carbon footprint is reduced by optimizing the chassis weight of a prototype electric vehicle. The work will be presented in 4 sections. The introduction starts the presentation to show the state of the art of study. The methods show the steps of data collection and chassis model. Results and discussion become the third part. The final part is the conclusion showing some found of the work.

2 Methods

Basic of LCA of energy and material used for the chassis fabrication will be estimated for the carbon footprint. The data of the energy for production uses PLN report of 2022. The emission of the energy is calculated using energy mix of the PLN and energy need for the production of the chassis. The energy for production consists of energy for material production and manufacturing production. The operational energy consumption is estimated in the form of the difference.

2.1 Energy mix footprint

Indonesia Electricity Company (PLN) produced 273,761 GWh. The primary energy of the electricity consists of diesel fuel, coal, natural gas, geothermal, water, biomass, solar, and wind. The distribution of primary energy usage for electricity generating is presented in Table 1. The CO₂ emission equivalent for electricity generation was reported 663.5 gr/kWh [5].

Table 1. Electricity Generation according to energy type.

Type of energy	Generated Electricity (GWh)	percentage
Oil Fuel	17,186	5.58
Coal	192,563	62.52
Natural Gas	68,315	22.18
Geothermal	6,899	2.24
Hydro	1,016	7.48

2.2 Chasis CO₂ Emission Footprint

Chassis CO₂ emission footprint consists of emission of metal production, manufacturing process, and metal destruction. The steel production emission was reported 1215.17 kg CO₂ equivalent/ton [6]. The aluminium CO₂ equivalent emission was 7.15 ton/ton aluminium as the mean number [6]. In addition to steel production, the manufacturing consists cutting process, and welding process. The emission of chasis can be calculated using equation (1) as follow. The E_{CO2T} , E_{CO2P} , E_{CO2M} , and E_{CO2D} are CO₂ equivalent emission of chasis, material production, manufacturing process, and demolishing, respectively. The manufacturing process is composed of cutting and welding. Therefore, the emission of the manufacturing process can find using equation (2) applying equation (3) and (4) for calculating the cutting and welding emission respectively. The demolishing of the metal, as it is recyclable, the number applies percentage of metal production using recycle material which is 10% [6]. The metal production and its scrapping can be calculated using equations (6) and (7) respectively.

$$E_{CO2T} = E_{CO2P} + E_{CO2M} + E_{CO2D} \quad (1)$$

$$E_{CO2M} = E_{CO2cut} + E_{CO2weld} \quad (2)$$

$$E_{CO2cut} = Energy\ cutting\ (kWh) * 0.6635\ kg \quad (3)$$

$$E_{CO2weld} = Energy\ welding\ (kWh) * 0.6635\ kg \quad (4)$$

$$E_{CO2M} = Operation\ time * E * 0.6635\ kg \quad (5)$$

$$E_{CO2P} = Mass\ material\ (kg) * 7.15\ kg \quad (6)$$

$$E_{CO2D} = Mass\ material\ (kg) * 0.715\ kg \quad (7)$$

3 Results and discussion

The complete chassis consists of 3 sections, the main chassis, front arm, and rear sub-frame. Each chassis section fabrication is then analyzed for its energy usage requirements. Energy consumption when fabricating each chassis is divided into 2 main parts. First, the preparation of each component for the welding process, such as cutting, drilling, and grinding, and the final step is the welding process itself. Then, the chassis is arranged in such a way as to form a vehicle that can operate. Energy consumption when the vehicle is operating is also then analyzed, which is then totaled by energy use during fabrication. The total energy used during chassis fabrication and when the vehicle is in operation is then converted into CO₂ equivalent.

3.1 Energy consumption for cutting, drilling, and grinding

The first step of fabricating a chassis is cutting the aluminum square tubing, round tubing, and sheet to the required as needed according to the design. For square and round tubing, a 1,7 kW miter saw is used to cut straight or at an angle. For aluminum sheets, the most effective way to cut is using a 3,3 kW laser cut machine. 0,9 kW machine is used for drilling operations. 0,67 kW angle grinder is used for grinding operations.

The general formula to calculate the energy consumption of each process as written in Equation (8)

$$E = P.t \quad (8)$$

Where E is energy consumption, P is the power of the machine used, and t is processing time.

The energy consumption for the first step in fabricating the chassis is then put together in the table 2.

Table 2. Energy consumption for cutting, drilling, and grinding.

Chassis Section	Energy Consumption (kWh)	
	Chassis - Stock	Chassis - Lightweight
Main Chassis	0,0255	0,0596
Front Arm	0,0279	0,0645
Rear Sub-Framee	0,0818	0,0759
Total	0,1353	0,2000

3.2 Energy consumption for TIG welding

The final process for making a chassis is to combine each component that has been previously processed using a welding process. The TIG welding process is commonly used to weld aluminum. 6,1 kW TIG welding machine is used in this process.

The power and total energy consumption for TIG welding written in Equation (9) and (10), respectively

$$P = (V_{output} \cdot I_{output})/efficiency$$
$$E = P.t$$

(9)

(10)

Table 3. Energy consumption for TIG welding.

Welding Process	Energy Consumption (kWh)	
	Chassis - Stock	Chassis - Lightweight
Main Chassis	1,433	0,373
Front Arm	0,442	0,317
Rear Sub-Chassis	1,711	0,312
Total	3,586	1,002

3.3 Energy consumption while the vehicle is operating

Simulation of energy consumption (in Joule) when both vehicles are operating is then compared using Equation (11), and then converted to energy consumption (in kWh) using Equation (12). The difference between both vehicles is the mass of the vehicle, while the other specifications are the same. Vehicle specifications and energy usage results are shown in the table.

$$E_j = (\mu.m.g.Cos\Theta)+(m.g.Sin\Theta) +(0,25.C_d.A.p.(v_i^2+v_f^2).d)+(0,5.m.(v_i^2+v_f^2))$$
$$E_{wh} = E_j.0,000278$$

(11)

(12)

Table 4. Chassis specification.

Specifications	Vehicle Chassis Type	
	Chassis - Stock	Chassis - Lightweight
Mass of vehicle, m (kg)	94,3	84,2
μ	0,004	
Gravitational acceleration, g (kg/m ²)	9,8	
Road elevation, θ (°)	0	
Coefficient of drag of vehicle, C_d	0,15	
Frontal area of vehicle, a (m ²)	0,37	
Density of air, ρ	1,293	
Initial speed of vehicle, v_i (m/s)	8,5	
Final speed of vehicle, v_f (m/s)	0	
Diameter of vehicle's wheel, d (mm)	100	
Energy consumption, E (J)	3539,90	3174,64
Energy consumption, E (kWh)	0,98	0,88

3.4 The emission

The CO₂ emission for both chassis from fabrication to demolishing can be shown in Table 5.

Table 5. Emission of the chasis life cycle.

Cycle	Emission (kg)	
	Chasis Stock	Lightweight Chasis
Material Production	674,245	602,03
Manufacturing Process	2,469	0,798
Operation	130,046	116,776
Demolishing	67,424	60,203
Total Emission	874,185	779,806

Table 5 shows the emission of the chassis life cycle. It mentions that the material dominates the chassis emission. The second emission contributor is the operation assuming 200 hours of operation for the training and competition. Manufacturing is the least significant contributor to the emission. In the transportation sector, electric vehicles will help to reduce carbon emissions [7]. In general, increasing vehicle weight causes an increase in total carbon emissions [8]. The electric vehicles that powered by battery dan recharged using renewable energy resources is producing the lowest amount of total life-cycle emission [9]. The larger weight of electric vehicle compared to internal combustion electric vehicle (hybrid) cause 59% more CO₂ emissions [10]. Therefore, optimization of the chassis weight prototype electric vehicle has a great impact on the total CO₂ emission.

4 Conclusion

The lightweight chassis can reduce CO₂ emission by 11% assuming 200 hours of operation. The stock chassis has 874.2 CO₂ emissions, while the lightweight has 779.8 kg. The material is the main contributor to the emission. Therefore, optimization of the chassis weight significantly reduces the emission.
