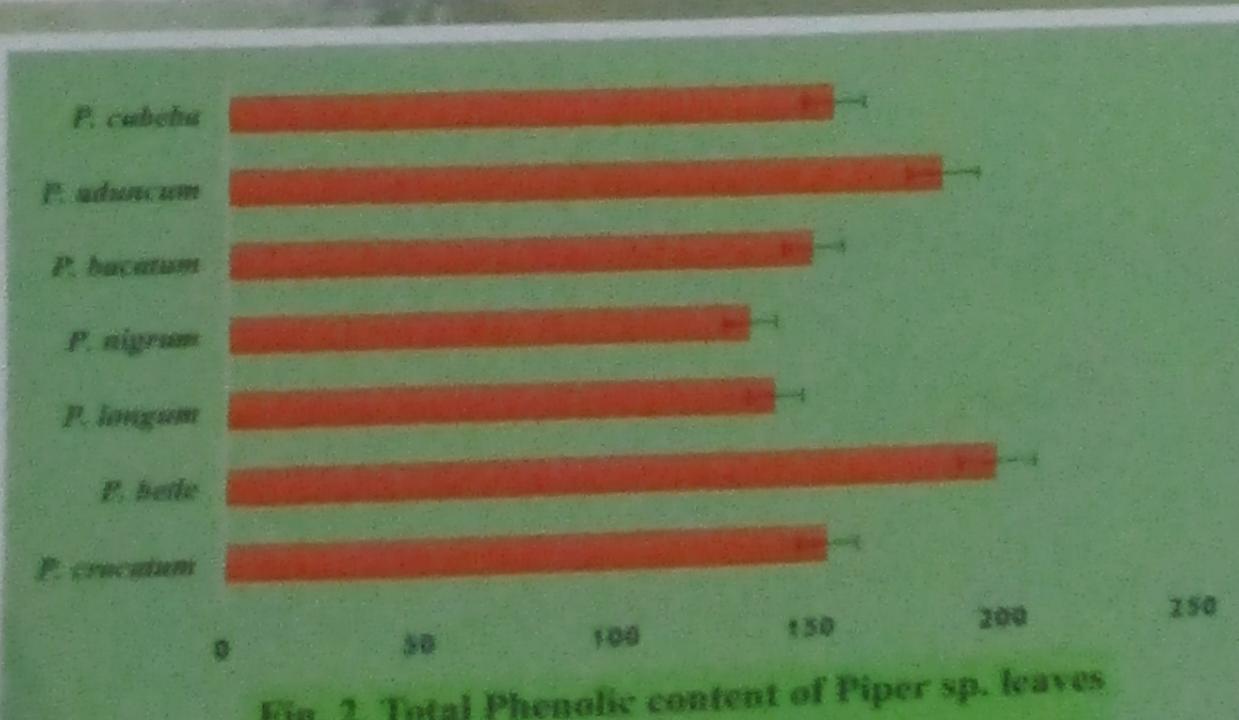

Fig. 2. Total Phenolic content of Piper sp. leaves methanolic extract

#### Abstract

Phagocytic cells play an important role in the immune system mechanism. However when the phagocytic cells were over activated, the cells will be damaged through their Reactive Oxygen Species (ROS) and Nitric Oxide (NO) productions. In the phagolysosome process, inducible Nitric Oxide Synthase (iNOS) and RNS were activated. Nitric oxide is a product of arginine cation catalyzed by iNOS enzyme. The methanolic extract of red betel (*Piper crocatum* Ruiz & Pav.) leaf is an immunostimulant, which is able to increase macrophages phagocytic activity known relatively high. However the mentioned activity did not over produce of NO. The mention condition may be due to the ability of red betel leaf to keep safe the function of immune cells from the effect of macrophage phagocytic over activity. The aim of the current research was to investigate the red betel leaves methanolic extract antioxidant activity and then compared to those of rutin and *Piper betel* methanolic extract. It is known that rutin is an immunostimulant and antioxidant while the methanolic extract of *P. betel* is an immunosuppressant and antioxidant. Furthermore, red betel leaves are widely used as a traditional medicine in Indonesia. *In vitro* phagocytic activity test of macrophages showed that the methanol extract of red betel (*Piper crocatum*, Ruiz & pav.) leaf had immunostimulant activity (Hartini et al., 2013). Unlike the red betel initially used as an ornamental plant, green betel (*P. betel*) is a species of the genus *Piper* was widely used Indonesian people as a traditional medicine. Kanjwani et al. (2008) reported that the methanol extract of green betel leaf has immunosuppressive activity. In addition to red and green betel, some species of the genus *Piper* also used as traditional medicine. Rutin is an antioxidant compound and at the levels higher 50 μg/ml showed significant stimulatory effect (Zhao et al., 2007; Yang et al., 2008).

Keywords: red betel (*Piper crocatum* Ruiz & Pav.), extract, antioxidant, *Piper* species.

#### INTRODUCTION

Currently people use traditional medicine because it has a psychological appeal than modern medicine. In certain circumstances, modern drugs tend to be expensive, sometimes painful effect, and have less opportunity to be recognized (Spinella, 2005). Recently, betel leaves are widely used as a traditional medicine in Indonesia. *In vitro* phagocytic activity test of macrophages showed that the methanol extract of red betel (*Piper crocatum*, Ruiz & pav.) leaf had immunostimulant activity (Hartini et al., 2013). Unlike the red betel initially used as an ornamental plant, green betel (*P. betel*) is a species of the genus *Piper* was widely used Indonesian people as a traditional medicine. Kanjwani et al. (2008) reported that the methanol extract of green betel leaf has immunosuppressive activity. In addition to red and green betel, some species of the genus *Piper* also used as traditional medicine. Rutin is an antioxidant compound and at the levels higher 50 μg/ml showed significant stimulatory effect (Zhao et al., 2007; Yang et al., 2008).

#### METHOD

Authentication materials in the form of plants of various species of *Piper* namely sirih merah (*P. crocatum*), sirih betel (*P. betel*), sirih lengkung (*P. aduncum*), lada (*P. nigrum*), kemukus (*P. cubeba*), rimu (*P. bacatum*), and cabe jawa (*P. longum*) were conducted at the Faculty of Biology UGM. Maceration method was used to extract the compound of various *Piper* species. Antioxidant activity test used DPPH method. Preparation of plant material refers to the preparation stages of plant extraction according to Kumar et al. (2016). Rutin was used as a positive control. Inhibitory Concentration (IC<sub>50</sub>) values were calculated from the linear regression equation by plotting the average percent concentration of antioxidants and antioxidant activity (Alam, et al., 2013; Jagdale, et al., 2009, dan Kumar, 2016).

#### RESULT AND DISCUSSION

The test results showed that antioxidant activity (IC<sub>50</sub> values) of *P. crocatum* leaf extract was higher than those of *P. betel* or rutin. The average of IC<sub>50</sub> leaf extract *P. crocatum*, *P. betel*, and rutin was 84.341 ± 6878 μg/ml; 26.915 ± 0.455 μg/ml, and 0.135 ± 0.0004 μg/ml respectively. Rutin used as a positive control in this study is a compound isolated from plant known to have an antioxidant activity and an immunosuppressive (Zhao et al., 2007; Yang et al., 2008). Conversely, *P. betel* is known as an antioxidant but an immunosuppressive (Kanjwani et al., 2008). The IC<sub>50</sub> value of *P. crocatum* was higher than those of *P. betel* or rutin. In other words, the potency of *P. crocatum* as an antioxidant was lower than those of *P. betel* or rutin. In case of the same methanolic extract, *P. betel* had a higher antioxidant activity compared to those of *P. crocatum*. The phenolic compounds contributed significantly to the antioxidant capacity of the medicinal herbs (Cai et al., 2004). Therefore, it could be that phenolic content of *P. betel* higher than those of *P. crocatum*. Immunostimulant will enhance the immune system's ability to respond to the attendance of antigen. *P. crocatum* which is an immunostimulatory did not show higher antioxidant activity than *P. betel* which is immunosuppressants. Stimulation of the macrophage by *P. crocatum* may activate the enzyme iNOS and ROS, thus causing an adverse reaction to the cell. On the other hand, *P. betel* that do not stimulate macrophage. Therefore, even both species from the same genus, and extracted with the same solvent and method but they have different antioxidant activity. Rutin is an immunostimulatory cell proliferation of mice splenocytes. It is not stimulants phagocytosis of phagocytic cells. Rutin showed significant stimulatory effect and shows the potential for a powerful antioxidant at the levels of higher than 50 μg/ml. (Zhao et al., 2007).

The antioxidant activity of various species in the genus *Piper* showed that *P. betel* had a highest antioxidant activity followed by *P. aduncum*, *P. nigrum*, *P. cubeba*, *P. bacatum*, *P. crocatum*, and *P. longum* respectively. The content of total phenolic measured at the extract concentration of 200 μg / ml indicated that the highest total phenol content was *P. betel* followed *P. aduncum*, *P. cubeba*, *P. bacatum*, *P. crocatum*, *P. longum* and the lowest was *P. nigrum*. According to Cai et al. (2004), phenolic compounds contribute significantly to the antioxidant activity of plants. This research results supports previous opinion, total phenol content of the leaves of *P. betel* was highest compared to those of other species. Concomitant to the current results, the antioxidant activity of *P. betel* was also the highest compared to those of other species. In general, total phenolic content of 7 species of the genus *Piper* were ranging from 133 to 198 μg / ml. It indicates that the species of the genus *Piper* contained relatively high phenolic compounds. The antioxidant activity of *P. longum* was the lowest compared to other species, but the content of total phenols was not the least. It indicates that the compounds responsible for antioxidant activity were not only in the form of phenol compounds. Phenol and other compounds in the extract work together to produce an antioxidant effect. Interactions between compounds occur in the extracts known as endointeraction (Lila and Raskin, 2005) may cause a synergy effect which is more powerful effect compared to those of single compound (Heinrich et al., 2004).

#### CONCLUSION

1. *Piper betel* was the plant in the genus *Piper* which showed the strongest antioxidant activity followed by *P. aduncum*, *P. nigrum*, *P. cubeba*, *P. bacatum*, *P. crocatum*, and *P. longum* respectively.
2. The greatest total phenol content of 200 μg / ml extract concentration was those of *P. betel*, followed by *P. aduncum*, *P. cubeba*, *P. bacatum*, *P. crocatum*, *P. longum* and *P. nigrum* respectively.

## Certificate of Attendance

This is to certify that

**YUSTINA SRI HARTINI**

Has successfully attended at

**The 26<sup>th</sup> Asian Congress of Pharmaceutical Sciences  
Federation of Asian Pharmaceutical Associations**

held in Bangkok, Thailand  
on November 9-13, 2016

Assoc. Prof. Dr. Sindhchai Keokitichai  
President, The Pharmaceutical Association  
of Thailand under Royal Patronage

Mr. Joseph Wang  
President, The Federation of  
Asian Pharmaceutical Associations

# Certificate of Appreciation

Presented to

Yustina Sri Hartini

In recognition of the poster presentation entitled

The antioxidant activity of leaf methanolic extracts from various piper species

at the 26<sup>th</sup> Federation of Asian Pharmaceutical Association Congress (FAPA 2016)  
November 9-13, 2016 in Bangkok, Thailand

Assoc. Prof. Dr. Sindhchai Keokitichai  
Chair of Local Organizing Committee

Prof. Dr. Pornsak Sriamornsak  
Chair of Scientific Program Committee

## SURAT IZIN TUGAS LUAR

Nomor: 103/WR I/B.2/XI/2016

Pimpinan Universitas Sanata Dharma, Yogyakarta, dengan ini memberikan tugas kepada:

- Nama : 1. Aris Widayati, M.Si.,Ph.D.,Apt  
2. Dr. Rita Suhadi,M.Si.,Apt  
3. Dr. Yustina Sri Hartini, Apt  
4. dr. Fenty, M.Kes.,Sp.PK  
5. Dr. Christine Patramurti,Apt  
6. Dr. Dewi Setyaningsih, Apt  
7. Dr. Erna Tri Wulandari, Apt  
8. Dita Maria Virginia, M.sc., Apt
- Pekerjaan : Dosen Tetap Farmasi
- Unit Organisasi : Universitas Sanata Dharma
- Alamat : Paingan, Magiwoharjo, Depok, Sleman, Yogyakarta  
Telepon (0274) 883037 Fax. (0274) 886529
- Untuk Keperluan : Menghadiri Kongres Federasi Apoteker Asia Pasific (FAPA) 2016.
- Tempat : Bangkok, Thailand
- Waktu : 9 – 13 November 2016
- Biaya : Universitas Sanata Dharma

Dengan ketentuan bahwa:

1. Pelaksanaan tugas tersebut tidak mengganggu tugas pokoknya di Universitas Sanata Dharma.
2. Yang ditugasi memberikan laporan kepada Rektor tentang pelaksanaan tugas tersebut.

Yogyakarta, 8 November 2016

Wakil Rektor I

Drs. Tarsisius Sarkim, M.Ed., Ph.D.

Tembusan:

1. Wakil Rektor II
2. Kaprodi Farmasi
3. Kepala Biro Personalia
4. Kepala Biro Keuangan

JL. AFFANDI, MRICAN, TROMOL POS 29, YOGYAKARTA 55002
